FEBRUARY 1983

March 21, 1983

Ministry of Energy, Mines and Petroleum Resources British Columbia

Dear Sirs:

Enclosed please find our report on the Corbin Coal Mountain Property. Dr. Barry Ryan was in charge of the 1982 bulk sampling program on Corbin Coal Mountain Licences held by Shell Canada Resources Limited and operated by Crows Nest Resources Limited. He also prepared this report.

Dr. Ryan received his BSc Honours degree in Geology from the University of B.C. in 1967 and his PhD from the same University in 1973. He has worked for a number of mining companies before accepting a post with CNRL in April 1981.

I consider Dr. Ryan to be well qualified to expedite the geological field work and report preparation involved in this project. I am satisfied that the attached report dated January 1983 has been competently prepared and contains all pertinent information.

Yours very truly

H.G. Rushton Vice President, Development

The Corbin-Coal Mountain property (Coal Licence No. 414) covers approximately 259 hectares of the southern end of Coal Mountain in southeastern British Columbia. Coal mining activities have taken place in the Corbin area since 1908. The unusually thick coal in this area is well suited to recovery by surface mining methods.

The Corbin property lies 4 km directly west of the Alberta – British Columbia boundary, 53 km directly north of the United States border, and 28 km directly east of Fernie, B.C. A forestry road runs along the west side of the property providing access to Highway 3 near Sparwood, B.C., a distance of 23 km by road from Corbin townsite. A 20 km rail spur to Corbin townsite from the CP Rail line at McGillivray has been constructed by Byron Creek Collieries Limited which is presently producing coal from the northern end of Coal Mountain.

Coal Mountain lies within the Rocky Mountains and is an outlier of the Fernie coal basin. The property contains strata of the Mist Mountain Formation including one coal seam, the Mammoth Seam, which consists of an upper coal zone and lower high ash zone. The coal is oxidized bituminous coal suitable for use in electrical power generation. The strata on Coal Mountain have been subjected to an unusually high degree of folding and thrust faulting which have greatly thickened the Mammoth Seam. The upper coal zone achieves thickness of up to 35 metres. Seventeen rotary holes had been drilled on the property prior to 1978, eight full-cored holes were drilled during the 1978 exploration program and 11 cored holes and 1 rotary hole drilled during the 1980 exploration program. This drilling has resolved much of the structural complexity.

4/FUc.6

.

Ċ,

The Corbin-Coal Mountain property consists of one coal licence, Coal Licence No. 414, part of Group #6, which covers and area of 259 hectares. It is located in southeastern British Columbia and lies 4 km directly west of the Alberta-British Columbia boundary, 53 km directly north of the United States border, and 28 km directly east of Fernie, B.C. (Enclosure 1).

The Corbin-Coal Mountain coal licence covers the southern end of Coal Mountain near the former coal mining town of Corbin. Byron Creek Collieries is presently producing thermal coal from a surface mine on the northern end of the mountain.

The relief of the property is great, with the high point of 2090 m at the summit of Coal Mountain and the low point of 1550 m lying on Michel Creek to the west (Enclosure 2). The major portion of coal reserves lie high on the western flank of Coal Mountain.

4/FUc.7

A forestry road runs along the western edge of coal licence No. 414 and follows Michel Creek north to Highway 3 near Sparwood, B.C., a distance of 23 km from Corbin townsite. Access to the interior of the licence is from the south on an exploration road constructed by CNRL in 1978-1979. Previously access was through the Byron Creek minesite.

A rail spur from Corbin townsite to the CP Rail line at McGillivray, B.C. has been constructed by Byron Creek Collieries Limited (Enclosure 1). It is 20 km long and follows Michel Creek, paralleling a newly built public road which extends south, from Highway No. 3. Unit trains are presently hauling coal from Corbin to Thunder Bay, Ontario, a distance of 2125 km. The rail distance from Corbin to Vancouver is 1140 km. 4.0 TENURE

۰. ا

۰.

The B.C. Coal Licences granted to Crows Nest Industries Limited on September 19, 1974, are now held by Shell Canada Resources Limited and operated by Crows Nest Resources Limited. These three coal licences, Nos. 412, and 414, Group No. 6, cover 713 ha. of Crown land.

- 5 -

The Corbin-Coal Mountain property is on C.L. No. 414, covering 259 hectares, (Enclosure 3). The present legal standing of this licence is described in Table 1 (Land Tenure Standing Sheet).

TABLE 1

#### 5.0 WORK DONE

Ś

.

#### 5.1 Prior to 1982

Prior to 1978 Crows Nest Industries Limited carried out several exploration programs on the Corbin coal licence. This work included geological mapping and drilling and geophysical logging of 17 rotary drill holes.

The 1978 exploration program done by Crows Nest Resources involved drilling eight fully cored diamond drill holes. Geological mapping, aerial photography, surveying and road construction were also carried out. A compilation of all work done to 1978 was submitted in June, 1979 in the fourvolume Crows Nest Resources Limited 1979 Corbin Geological Report.

During 1979 2.1 km of road designed to provide southern access to the coal licence was completed and upgraded. This work was reported in the Crows Nest Resources Limited 1980 Corbin-Coal Mountain Property report.

The 1980 exploration program involved upgrading the southern access road. Eleven drill holes totalling 1778 metres were cored and geophysically logged. All coal intersections were sampled and sent to CNRL lab for analysis. One rotary hole was attempted but was abandoned at 52 metres due to caving problems. Trenching and detailed mapping were done throughout the exploration program. Backhoe trenches totalling 1.34 km were dug on existing roads an 1.55 km of new drill hole access roads. This work was reported in the Crows Nest Resources Limited 1981 Corbin-Coal Mountain property report.

#### 5.2 1982 Bulk Sampling Program

A small bulk sampling program was undertaken in late September early October. In three locations existing roads were slightly widened into the bank and backhoe trenches cut adjacent to the bank. A total of 11 tonnes of raw coal were collected from the three trenches. The trenches are located on Enclosure 2.

The southern trench (1) was 22 m long, the northwestern trench (3) was 60 m and the northeastern trench (2) was 44 m long. Details of the trenches are provided in a table (Table 2).

Samples were taken using a John Deer 410 Backhoe. The thickness of cover over the trench tops varied from 1 - 3

¢,

ŝ,

metres. The trenches were then dug down an additional 1.5 metres at a width of 1.2 metres which is twice the bucket width. Samples were taken from a cut down the center of the trenches thus preventing side wall contamination.

4/FUc.14

Samples were dumped directly into 45 gallon drums which were labelled and sealed on site before shipment to Calgary.

The costs of the 1982 bulk sampling program were 11,861.13. Details of previous years expenditures are provided in Table 3 (The Application to Extend Term of Licence).

è

Trench 2 was a very good site, the coal although oxidized was relatively fresh with very little evidence of any brown staining usually accompanying badly oxidized surface coal. Trench 1 was also relatively fresh although there was brown staining on some of the coal sampled. Sample 3 was a more difficult sampling situation as it had a good depth of cover to the south but gradually lost cover as it advanced to the north. In this area we dug down in the order of 2.5 metres but the coal was still badly oxidized in the last 3 to 4 metres of the trench. The effects of this oxidization showed up in the test results in the form of increased fines and poor calorific value.

Samples were sent to Bir Fley for sizing and washability studies. The results are reported in (Table 4). Average ash values for the three samples are 1, 22.14%, 2, 18.2% and 3, 19.66%. The 50 to 6mm size fractions for the three samples wash to a 16% ash product with an average yield of 85% and the 6 - 2mm fractions wash to a 16% ash product with an average yield of 92%. In all cases the 2mm - 0 material is less than 16% ash.
