MOUNT KLAPPAN COAL PROJECT

APPENDIX V

COAL QUALITY DATA

FOREWORD

The data contained within this Appendix represents the results of the coal quality analysis and testing program undertaken by Gulf Canada Resources Inc. on the Mount Klappan Anthracite.

The coal quality analysis and washability studies were undertaken by Cyclone Engineering Sales Ltd. of Edmonton, Alberta and the petrographic work by D.E. Pearson and Associates of Victoria, British Columbia.

Discussion of Reflectance and

Mineral Matter Analysis

by

D.E. Pearson & Associates Ltd.

SAMPLE PREPARATION

The coal samples were coned and quartered and reduced to provide sufficient material for one pellet. This coal was then placed in pre-greased, re-useable METSERV 25 mm plastic moulds. Cold-set epoxy resin, to which had been added a portion of hardener, was then mixed with the coal and allowed to set. This is the preferred method of sample preparation for all ranks of coal, as it does not affect the reflectance of vitrinites nor the fluorescence of exinites. The pellets were subsequently ground and polished on Beuhler equipment.

PETROGRAPHIC EXAMINATION

The polished samples were examined using a Leitz Orthoplan Compact-model microscope-photometer, the control panel of which is interfaced to a Hewlett-Packard 85 microcomputer, an Epson MX-80 printer and a Hewlett-Packard 725A plotter, for electronic computation, tabulation and draughting of results.

Fifty individual vitrinite 'A' grains were measured for reflectance in the rank analysis. Standardization of photometer-readout was performed before the analysis and values were retained by the computer.

Five hundred counts were made in the mineral-matter analysis, using a x20 dry-lens.

RESULTS

The results of the analyses are contained in table form in the appendix. We have enclosed the individual readings made in the reflectance analysis, the basic statistics and computer-generated histograms of the reflectance data.

The mineral-matter percentages are contained in table form in the appendix.

DISCUSSION

All samples have vitrinite reflectances that place them well within the limits for anthracites, that is, greater than 2.2%. The samples are of similar rank; the actual range of reflectance is 3.21-3.766%, and all should have d.a.f. volatile matter yields of about 5%.

Mineral-matter contents are variable, and for the samples examined, range from 36% to 9%. Carbonate in mineral-matter is quite variable from 3% to 18%, and will cause considerable variation in Volatile-matter yield. Pyrite is not common, and quartz is present in amounts of 0.8% to 6%. Shale, is most variable, from 1.8% to 36%.
