SUMMARY

In July of 1986 a grant under the "Financial Assistance for Mineral Exploration" program was awarded to Westar Mining Ltd. The grant was used in an exploration program that was designed to establish proven reserves of high volatile met coal in the north end of Westar's Greenhills property. At the present time high volatile coal appears to be more marketable than our present products. During the program 9,400 metres of reverse circulation drilling was completed along with associated field and laboratory work.

Four main seams were encountered along with a myriad of minor seams which are generally lenticular and discontinuous in character. Quality of the seams encountered was generally as expected, i.e. high volatile, low difficulty coals that clean to a low ash.

Drilling density was sufficient to change about 70% of the coals in the area from the partially explored classification to the proven reserve category. A study on the feasibility and cost of mining this area is now underway. In total 74 million tonnes of high vol and borderline high vol coals were delineated, of which 52 million tonnes can be considered proven. Further development drilling is being planned for this area in the early summer of 1987.

1.0 INTRODUCTION

1.1 Location

The project area is located north of the existing Greenhills Mining Operation and just south of the Fording Coal Operations. The area is approximately 13 kilometres north and 2.5 kilometres east of the town of Elkford and 51 kilometres north of Sparwood, B.C. (Figure 1).

1.2 Access

A paved highway connects Elkford to the Fording Coal surface mine. Access to the project area is from this road via a secondary logging road through the south end of Fording Coal property. Access may also be gained via exploration roads from the north end of the Greenhills Mine.

1.3 Topography, Climate and Vegetation

The topography of the project area is the same as that of the Greenhills Mine. Cataract Creek, a year-round drainage, flows to the north along the east edge of the project area. Several ephemeral streams flow into Cataract Creek from the Greenhills Ridge to the west. The general relief of the area is approximately 450 metres between Cataract Creek and Greenhills Ridge. The upper one-third of the project area, to the top of the ridge, is covered with conifers. The lower section of the ridge is mainly open due to clearcut logging. The climate is the same as the Greenhills Mine area with cool summers and falls, rainy and wet springs, and cold winters with moderate to high snow falls.

1.4 Land Description and Ownership

During February of 1968 Westar Mining Ltd., then Kaiser Coal Ltd., acquired the coal rights on 43,725 hectares of coal-bearing lands from Crows Nest Industries Ltd. The High Vol Project area covers approximately 600 hectares and is a part of this acquisition. It lies just to the north of the present Greenhills Operations and forms a natural extension of the present operating pits. The property is located within Lot 1, District 4588, Plan Kootenay District Certificate of Title 117880.

2.0 OBJECTIVE OF PRESENT PROGRAM

2.1 Mine Overview

Westar's Greenhills Mine presently produces 2,100,000 tonnes of metallurgical coal and 800,000 tonnes of thermal coal per year. The market is extremely competitive and the current excess of supply will continue for several years. Recently coal prices have declined and markets have shrunk. To remain competitive, innovative means of increasing productivity and cost efficiency or developing new markets are continually under investigation.

2.2 Objective

A strong demand exists in the marketplace for high volatile coals with V.M. values greater than 30 percent. The objective of the program was to investigate the potential for high V.M. coals that existed in the north end of the Greenhills property. This potential was indicated by limited drilling performed in previous years. The target for this program is to identify these reserves, determine the potential for mining and if feasible, commence mining.

3.0 EXPLORATION WORK

- 3.1** Pre 1979 work in the project area was minimal. An access road was built in the early 70's and five rotary reverse circulation holes were drilled. In the mid 70's further bulldozer work for access and drillsites was completed and eleven core holes were drilled for structural and quality information.
- 3.2** Between 1980 and 1984, sixteen more rotary reverse circulation holes along with the associated cat work were completed using Greenhills' Schramm Reverse Circulation drill. This work was concentrated on the south and east sides of the present project area.
- 3.3** In 1985 another small program of twelve reverse circulation drillholes was undertaken with encouraging results. To carry out this program a contract drill rig and dozer were used.
- 3.4** During 1986 an extensive program was carried out with the aid of a Financial Assistance for Mineral Exploration (FAME) grant from the Provincial Government of B.C. Approximately 12,000 metres of road were built using a contracted D8K Caterpillar dozer. During the program fifty-six 13 cm diameter C.S.R. (centre sample return) drillholes were completed. Thirty-eight of these, for a total of 6,656 metres, were completed by S.D.S. Drilling on a per metre contract basis. The two contractor rigs utilized during the project were a Cyclone TH70 and a Gardner-Denver 1700. Both rigs were equipped with a top drive, reverse circulation pipe and 600 cfm, 250 psi air compressors. Eighteen holes for 2,751 metres were drilled utilizing our own Schramm T685D reverse circulation drill carrying a 750 cfm/350 psi compressor.

4.0 DRILLING, SAMPLING, ETC.

4.1 Drilling

The drilling was concentrated in areas of greatest potential for high volatile coal within the project area. Fifty-six holes were drilled for a total of 9,400 metres. The average hole depths were 168 metres and the maximum depth was 314 metres. All the holes drilled started off at 130 mm or 140 mm in diameter and were reduced as required down to a minimum of 120 mm in increments of either 3 or 6 mm. All holes were started vertically and no deviations were run on any of the fifty-six holes in this program. Table 1 lists the coordinates of all the holes drilled in the project area during the 1986 program. Map 481-1 (in pocket) shows the location of all the holes drilled as well as all the previously existing and new roads in the project area.

4.2 Sampling and Assaying

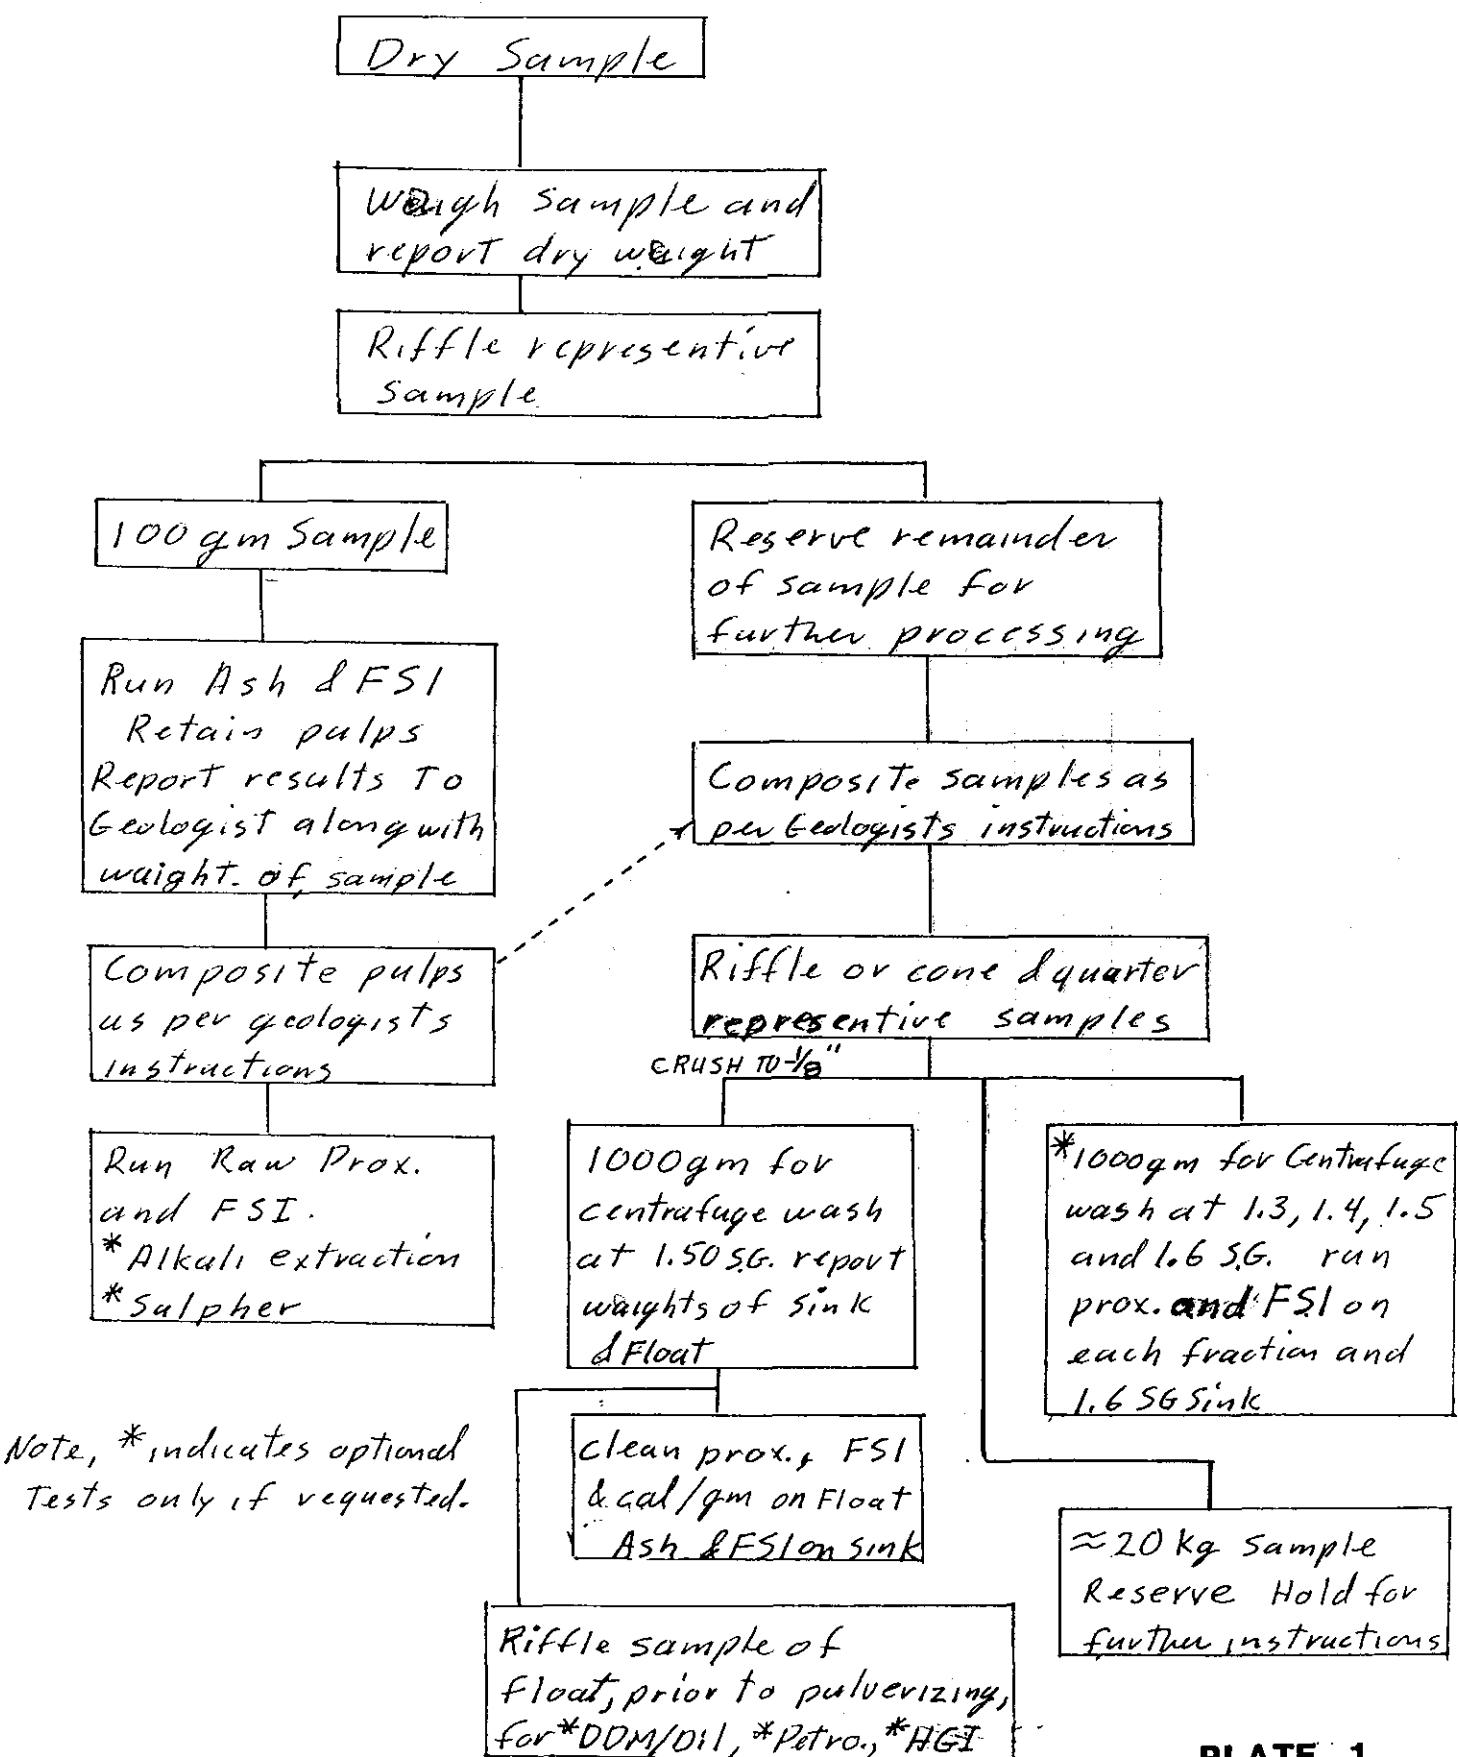

Assay work on all drill hole coal intercepts was performed by either Birtley Coal and Mineral Testing in Calgary or Westar's Central Laboratory in Sparwood, B.C. The same procedures were followed by both laboratories. Copies of the procedures are shown in plates 1, 2 and 3.

All coal zones were sampled in either two foot or 0.5 metre increments. These increments were then sent to the lab for analysis of ash and F.S.I. Lab results were then returned to the Geology Department and composites were determined based on these results. The incremental samples were combined by the lab to form composites to represent seam intervals. Composites were subjected to the standard tests as outlined in the procedures plus any optional test which was required.

PROCEDURE B-GH

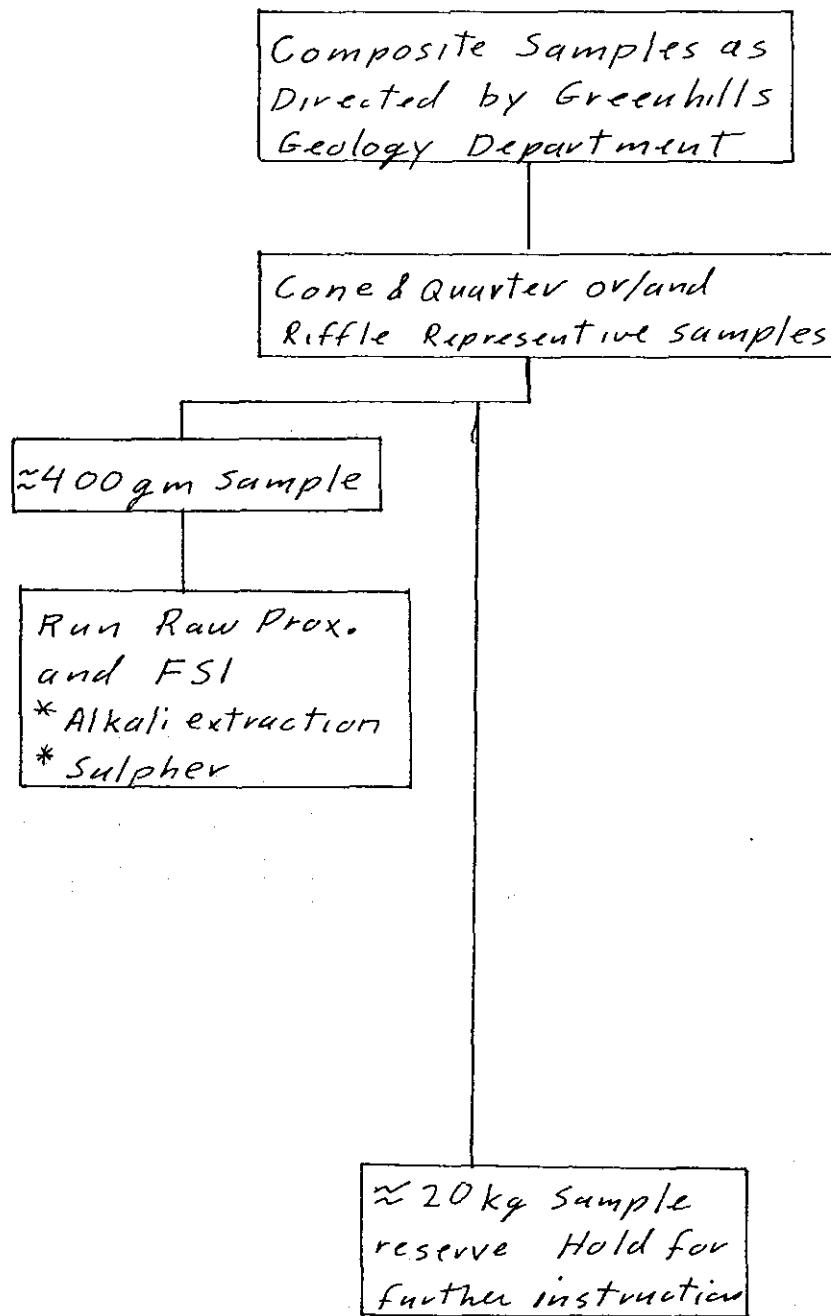

PROCEDURE C1-GH

Note; * indicates optional tests to be performed only on request.

PROCEDURE C2-GH

Note; * indicates optional tests to be performed only on request.

Table 2 gives a summary of the Quality by Seam for the major seams of interest and Appendix I gives the available raw data for the coal intercepts encountered in the 1986 drilling program.

4.3 Hole Logging

All the holes drilled in the 1986 program have been logged using a Model T450-E S.I.E. Gamma ray downhole logger. A copy of all the logs for the holes drilled during the 1986 High Vol program are included in the pocket in the back. Because of manpower constraints, chip logs were not made and chips were not saved. Although it was realized that deviation logs would be useful for more accurate structural interpretation, they were not run at the time because of time and manpower constraints. Deviation surveys will be run during 1987 as time permits. Seam intercepts from the gamma logs were used in determining hanging wall depths and seam thicknesses for coal intervals.

5.0 GEOLOGY

5.1 General Geology

The project area lies within the top half of the Mist Mountain Formation which is the coal-bearing horizon of the Kootenay Group of the upper Jurassic-Lower Cretaceous Era. The upper Mist Mountain Formation is interpreted to have been deposited in an upper deltaic-plain or alluvial plain depositional environment. The predominant lithology is fine-grained sandstones, siltstones and mudstones interspersed with carbonaceous zones and coal seams. Coal seams vary from regionally continuous to very limited in lateral extent resulting in the amount of coal in the stratigraphic section varying greatly from place to place within the project area. Plate 4 is a generalized stratigraphic column of the Mist Mountain Formation.

5.2 Structure

The major structure affecting the reserve area is the Greenhills syncline which is north-south trending and plunges gently to the north. The beds on the west side of the axis dip easterly up to 45° except in the vicinity of the axis where the structure has been complicated by drag folding, minor thrust faulting and late small scale normal faulting. The beds on the east limb dip steeply to the west and are cut off on the east by the Fording River normal fault which has a displacement of several hundred metres. The beds on the east limb have been structurally disturbed by numerous minor thrust and normal faults. Map 481-2 (in pocket) illustrates the major structural features and the projected seam outcrops of 16, 20, 22 and 25 Seams in the Hi-Vol project area. Cross-sections A-A through J-J, which are included in the pocket, are drawn between holes and show the structural configurations of the coal seams in relation to the major structural features of the project area.

Also include in the pocket in the back are copies of computer-generated hangwall and isopac maps for seams 16, 20, 22 and 25. These are the same maps that were used to generate the reserve volumes.

6.0 ECONOMIC GEOLOGY

6.1 Seam Descriptions

The main thrust of the project was to develop high volatile reserves and with this in mind only seams 16L and above were considered in the present program. The number of seams vary from drillhole to drillhole but four seams; 16, 20, 22 and 25, appear to be more or less continuous throughout the area.

6.1.1 16 and 16L Seams

These are a continuation of 16 and 16L Seams in the Cougar North development. 16 Seam is the most continuous of all the seams in the north dump area. The thickness is variable from 11 metres to 5 metres and is generally thinning to the north. These seams range in ash from 12% up to 30% with 16L nearly always being higher in raw ash than 16 Seam. These seams are borderline High Vol with dry-ash-free V.M.'s of 30% to 32%.

6.1.2 20 Seam

20 Seam varies between 0 and 7 metres thick and does not show any consistent thickness trends. It lies 30 to 50 metres above 16 Seam and sometimes occurs as split into an upper and lower seam. The seam(s) are generally quite clean with an ash of 14% to 20%. 20 Seam is the first seam in the section which consistently falls into the high vol classification of greater than 31% V.M. on air-dry mineral matter free basis.

6.1.3 22 Seam

This is a zone rather than a single Seam and usually contains two or more seams of varying thickness over a 10-15 metre interval. Total coal in the zone can be as much as 6 to 8 metres. The zone lies 20 to 40 metres above 20 Seam on the west side of the syncline and only 5 to 20 metres above on the east side. Ash in the 22 seams varies from 8% up to 25% and V.M. in 22 Seam is about 33% on a dry mineral matter free basis (dmmf).

6.1.4 25 Seam

Seam 25-26 is located 20 to 40 metres above 22 Seam and is occasionally over 5 metres thick. In some areas this seam is quite dirty due to numerous rock splits which occur. Raw ash varies dramatically between 10% and 45% in direct relation to the number and thickness of the splits which occur. V.M. on d.m.m.f. is in the range of 34%.

6.1.5 Remaining Seams

A myriad of seams, other than those already mentioned, occur within the project area. The seams vary in thickness from a few tenths of a metre to over 7 metres. These seams are usually discontinuous and lenticular in shape making correlation difficult. Some of the thicker seams may extend up to several hundred metres in any given direction. These seams form part of the reserve base where they are over 1.5 metres thick but otherwise are excluded. In practice, however, seams with thicknesses less than 1.5 m thickness are presently being recovered.

6.2 Quality

The quality of the seams vary considerably with respect to parameters such as raw proximate, washability characteristics, and reological tests. All the seams above 16 Seam, however, have one thing in common, on the basis of reflectance and clean V.M.'s they are classed as High Volatile coals. The upper seams that are 16 and up have generally proven to be very easy coals to clean with difficulties ranging 10% to 20% at 1.55 S.G. and a clean ash of 6.5% to 7.5%. The exception which has been noted in the present mining operations is 20 Seam which gives a low yield when washed to a 7% ash.

Table 2 is a summation of the quality of the four main seams encountered in the project area. Appendix 1 gives a summary listing of all the available quality of all the coals by hole and by seam for the past summer's program. Appendix 2 is a compendium of all the available quality data by hole by seam for the high vol program in the North Dump area.

Table 2

	<u>16 Seam</u>	<u>20 Seam</u>	<u>22 Seam</u>	<u>25 Seam</u>
Seam Thickness				
Raw: Ash %	12-30	14-20	8-25	10-40
F.S.I.	7-8	6-8	7-9	7-9
Clean: R.M.	1.0	1.0	1.1	1.1
at Ash	6.3	7.5	7.4	6.2
1.50 V.M.	28.9	29.7	30.7	31.6
S.G. F.C.	63.8	62.8	61.8	62.1
F.S.I.	7-8	7-9	7-9	7-9

6.3 Reserves

Reserves for the project area referred to in this report are defined as follows. All coal in all seams starting at 16L Seam and working up-section until no more sections are encountered. Reserves of economic interest have not have been outlined at the present. Work will begin on this phase as soon as the data is in a suitable format for detailed mine planning.

Table 3 gives an estimate of the reserves by seam. These reserves are computer-generated based on grids created for the topographic surface, the hangwall of the coal and the seam isopach. The High Vol exploration program has moved about 70% of the North Dump area reserves from partially explored into the proven category.

Dozer Work Excavation & Removal	
Roads & Drillsites	\$ 48,926
Trenching (metres)	\$ \$ 48,926
	\$ 48,926
Other Exploration Costs (attach detailed schedules)	
Vehicles - 1 Pickup	\$ 3,825
	\$ 3,825
	\$ 3,825
Total Eligible Expenses	\$ 548,389

(b) For the following activities only 25% of total costs are eligible:

(c) TOTAL ELIGIBLE EXPENDITURES: \$ 548,389

(c) TOTAL ELIGIBLE EXPENDITURES: \$

- 8. SUPPLEMENTARY INFORMATION:** The following information is required in order to help us determine the contribution which mineral exploration activity makes to the economy, and relates to the utilization of B.C. vs. outside labour and services. Only figures directly attributable to the funded program should be included (approximate figures acceptable, but please be as accurate as possible).

(a) Employment, wages and salaries

Type	No. Employed		No. Person-days		Salaries/Wages Paid	
	B.C.	Outside	B.C.	Outside	B.C.	Outside
Prospectors					\$	\$
Linecutters						
Technicians	6		195		34,125	
General Labourers Sample Prep.			120	220	24,000	30,000
Drillers/Helpers	4	5	116	345	27,840	62,100
Equipment Operators						
Geologists	3	-	124		25,792	
Geophysicists						
Geochemists						
Engineers						
Supervisory	1		30		7,500	
Consulting						
Secretarial						
Managerial						
Legal						
Accounting						
Others (specify) Equip. Cat	2		45		6,480	
Others (specify)						
TOTALS					\$ 125,737	\$ 92,100

These figures are an estimate of direct wages and salaries with no burden applied and before taxes.

(b) Goods and Services

Description	Expenditure	
	B.C.	Outside
Meals, Groceries, etc.	\$	\$
Camping Supplies, Equipment, etc.		
Accommodation		
Transportations -- Scheduled Air		
-- Air Charter		
-- Vehicle Rentals		
-- Vehicle O and M Costs		
-- Other (specify)		
Equipment Rentals --	48,826	
Equipment Rentals -- Trenching, etc.		
-- Geophysical, etc.		
-- Other (specify)		
Contract Drilling		223,686
Consultant Services		
Assays and Analyses	83,000	42,000
Communications		
Other (specify)		

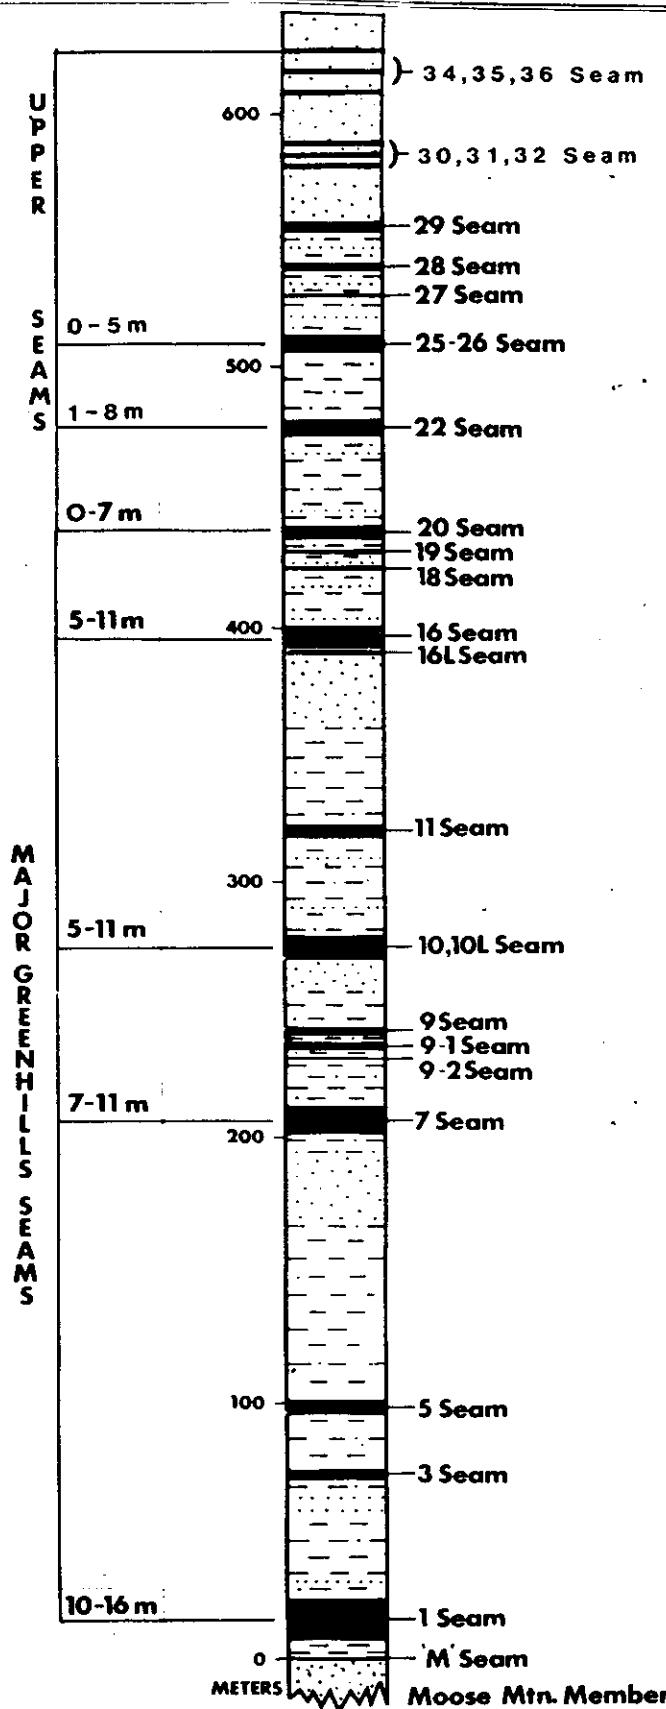

9. IMPACT OF FAME GRANT

(a) Please indicate what level of expansion of your project was attributable to receiving a FAME grant.

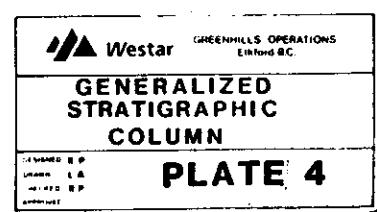

\$ 340,000 including grant
700 person/days employment.

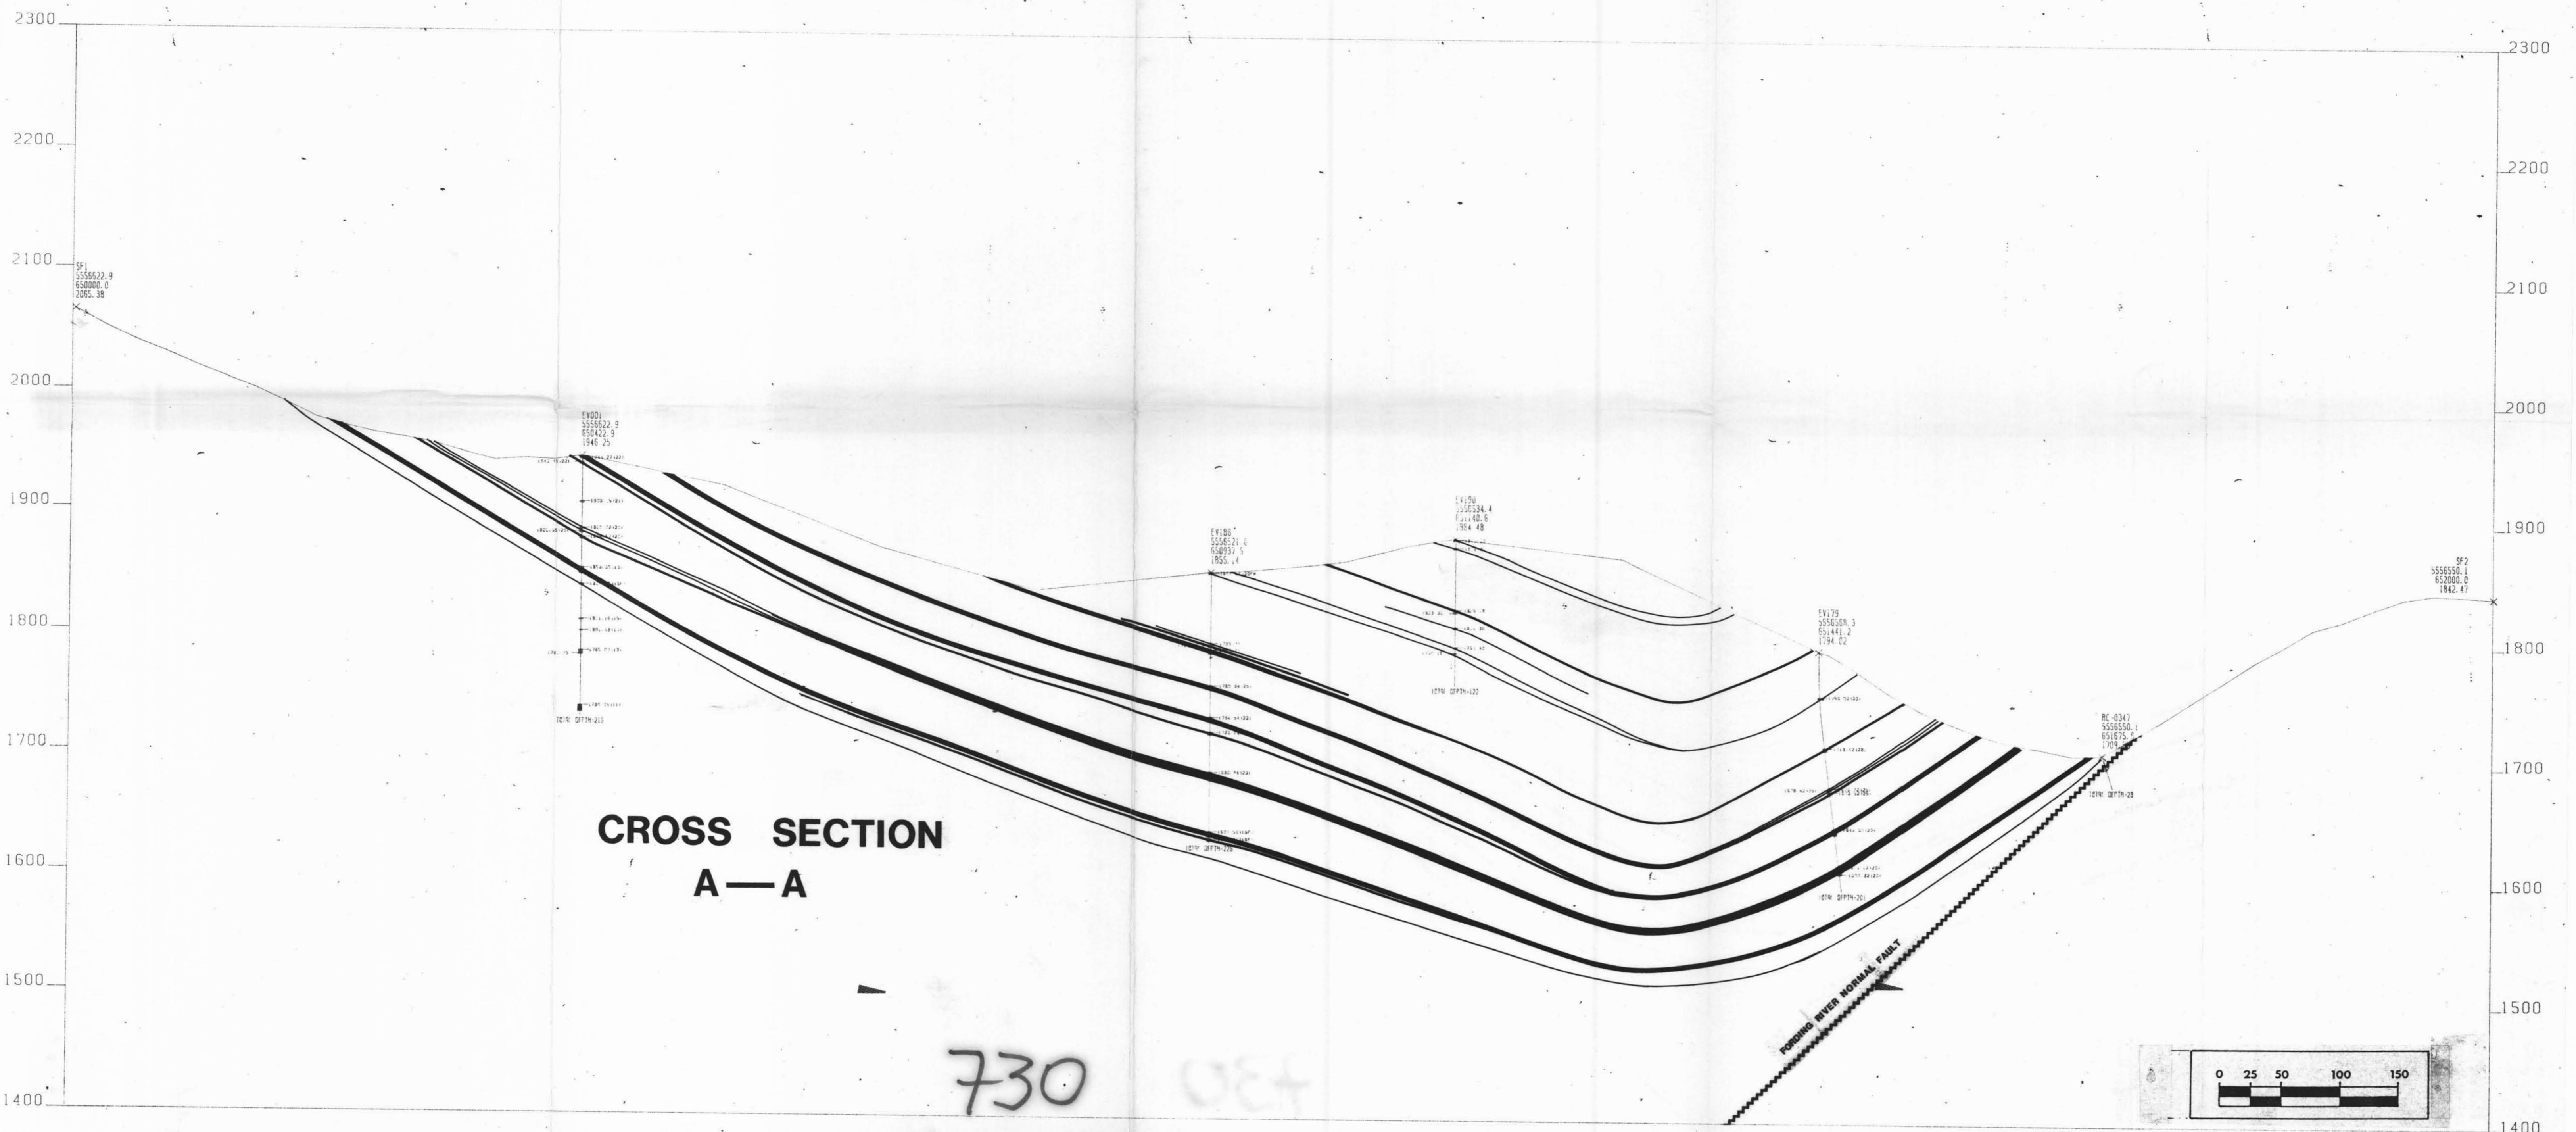

(b) Please indicate what you feel to be the main achievement of this FAME funded program.

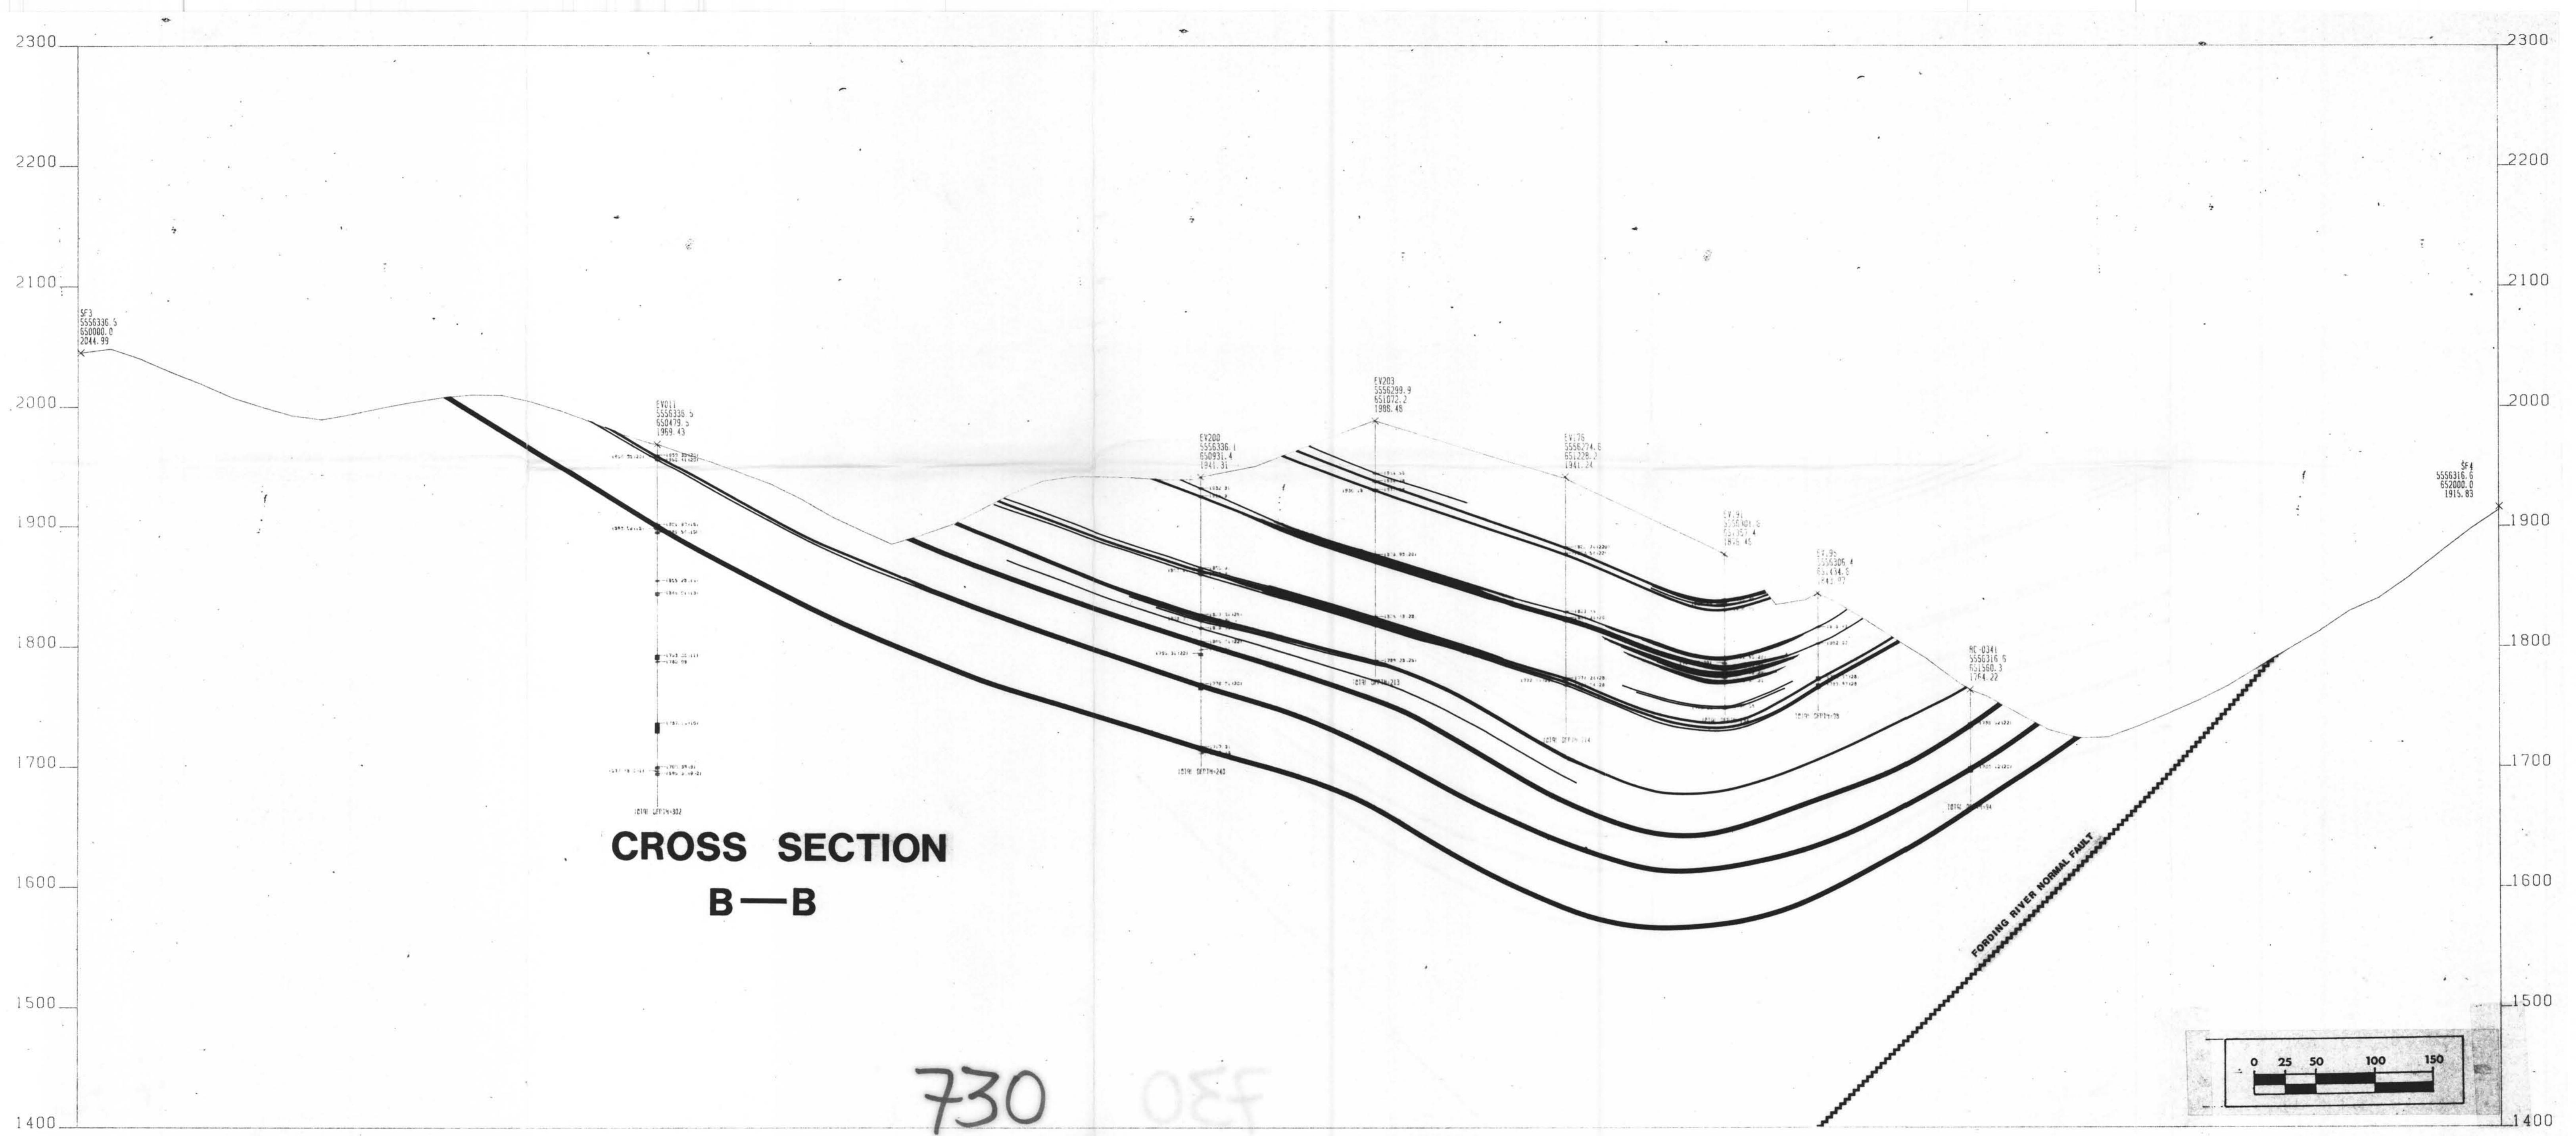

To move the mine into a more marketable product 1 1/2 to 2 years earlier than would have otherwise been possible, therefore maintaining the viability of the operation through the ability of the mine to keep volumes up and unit costs down.
