1987 GEOLOGICAL REPORT
TRANSFER, GRIZZLY AND PERRY CREEK AREAS

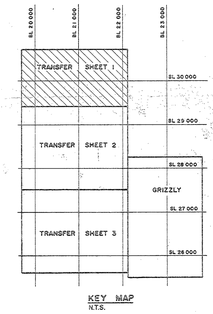
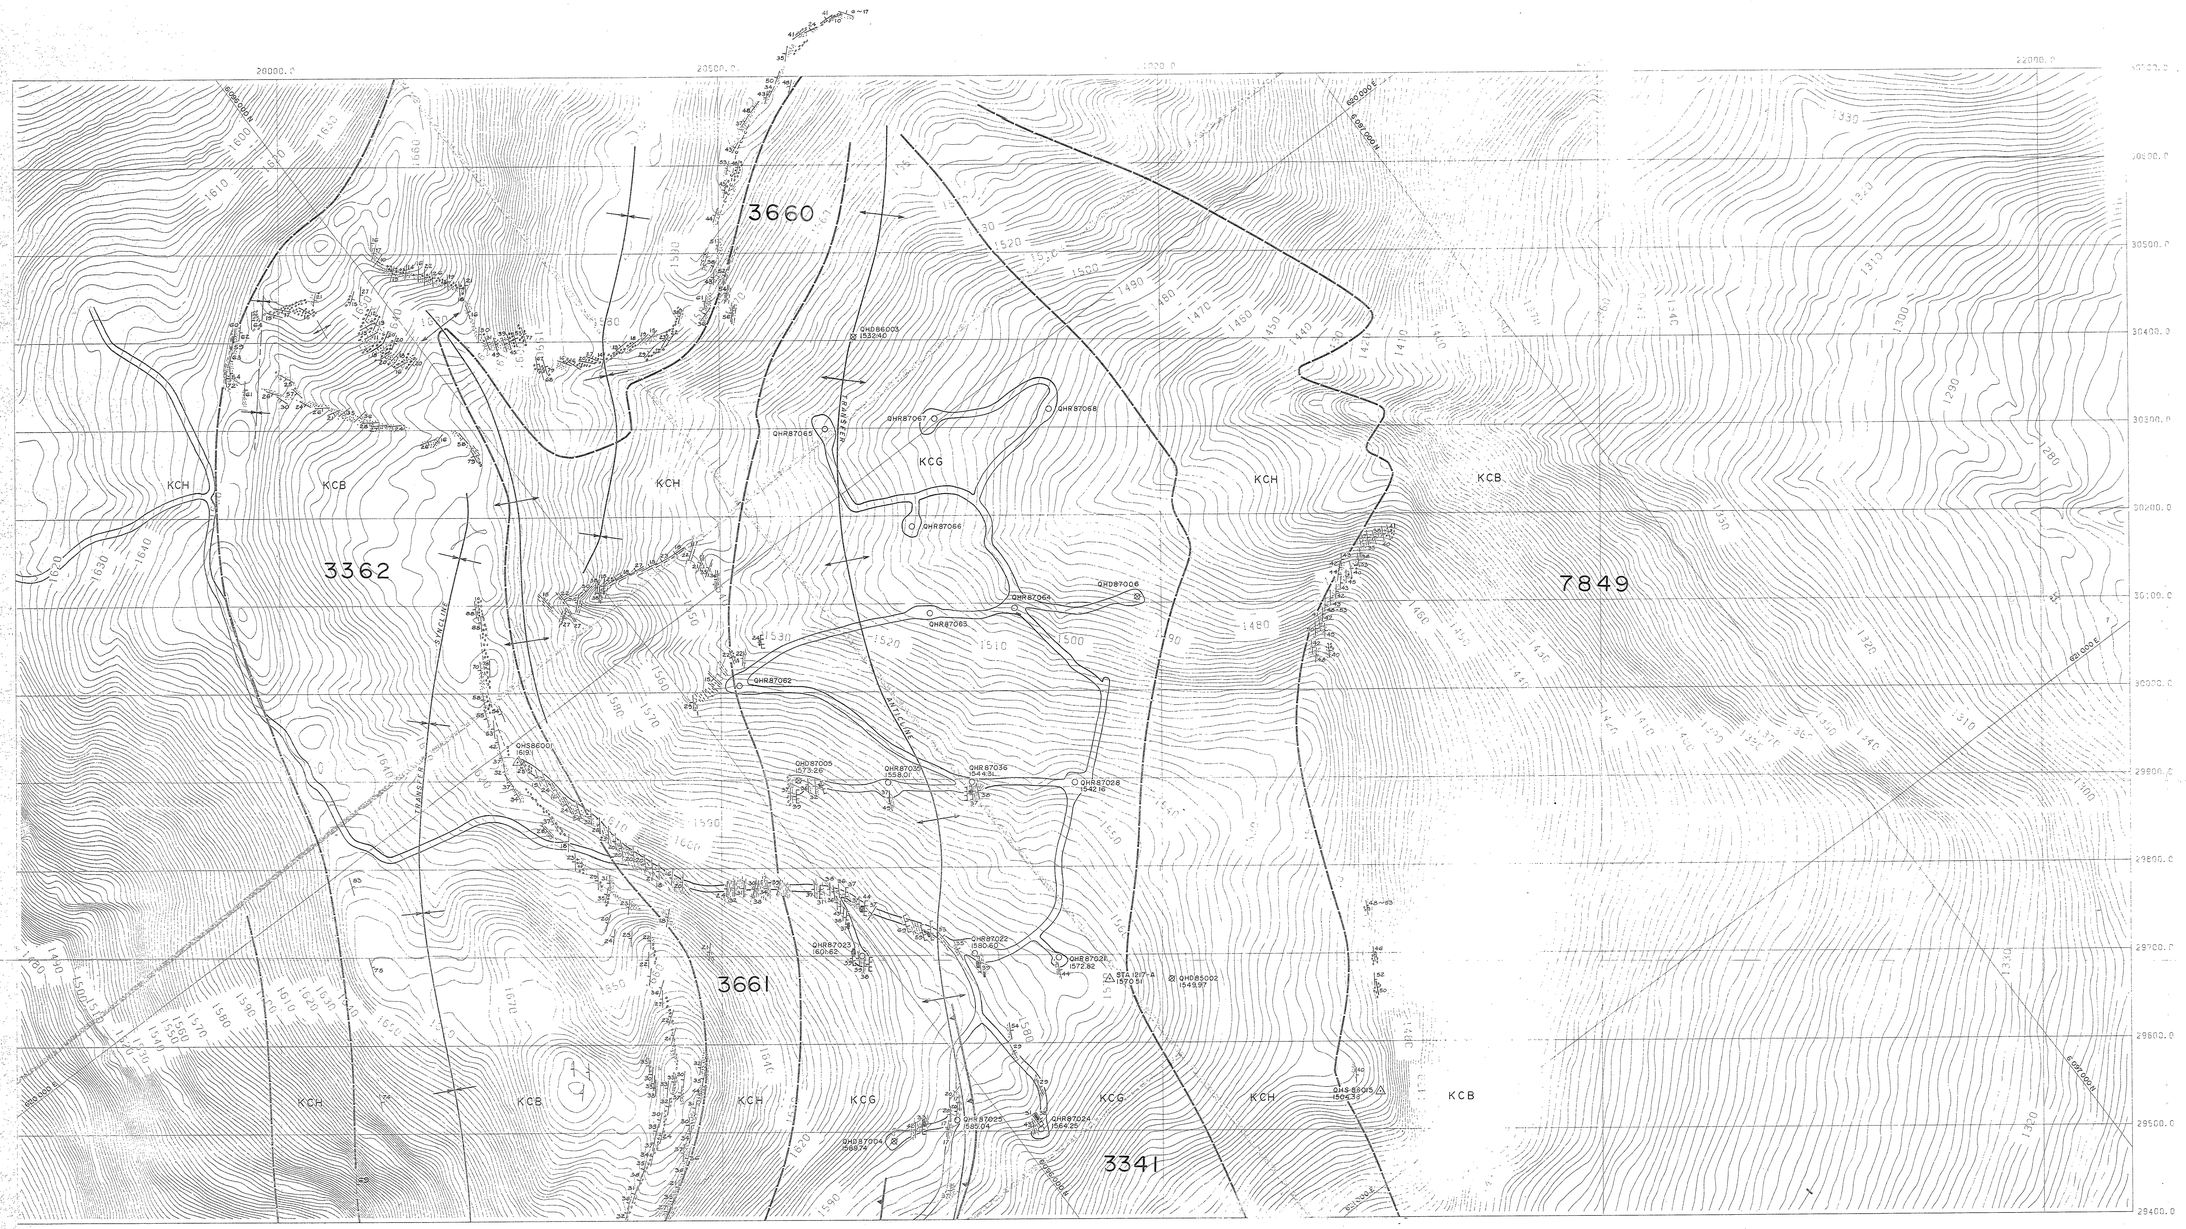
INDEX - APPENDICES



KEY MAP
N.T.S.



LEGEND

- ROADS
- TRENCH
- ROTARY DRILL HOLE
- DIAMOND DRILL HOLE
- THRUST FAULT
- ANTICLINE
- SYNCLINE
- GEOLOGIC CONTACT
- COAL SEAM OUTCROP
- CONTROL POINT w/ ELEVATION (e.g. QHR86 976.17)
- STRIKE & DIP - BEDDING (e.g. 132)
- STRIKE & DIP - COAL SEAM (e.g. 135)
- STRIKE & DIP - FAULT PLANE (e.g. 190)
- ADIT
- LICENCE BOUNDARY
- 7849 LICENCE NUMBER

LITHOLOGIC SYMBOLS

- CONGLOMERATE
- SANDSTONE
- SANDY SHALE (Siltstone)
- SHALE (Claystone)
- CARBONACEOUS SHALE
- COAL

GEOLOGIC FORMATIONS

- KS SHAFTSBURY
- KCB BOULDER CREEK
- KCH HULCROSS
- KCG GATES
- KM MOOSEBAR
- KCS CETKINO
- KCD CADOMIN

MESOZOIC

UPPER CRETACEOUS

KOu GUNYEGAH FORMATION: Marine and non-marine sandstone and shale

LOWER CRETACEOUS — FORT ST. JOHN GROUP —

KSh SHAFTESBURY FORMATION: Marine shale (North of the Wolverine River the Shaftesbury Fm. is differentiated into Hasler, Goodrich & Cruiser Formations)

KCr CRUISER FORMATION: Marine shale

KGo GOODRICH FORMATION: Fine grained sandstone

KHa HASLER FORMATION: Dark marine shale

KCm COMMOTION FORMATION Undifferentiated

KCmSs COMMOTION FORMATION, Boulder Creek Member: conglomerate, coarse to fine grained sandstone, shale, coal

KCmSh COMMOTION FORMATION: Hotnose Member: dark marine shale

KCmgl COMMOTION FORMATION: Gates Member: carbonaceous sandstone, shale, coal

KMb MOOSEBAR FORMATION: dark marine shale

— BULLHEAD GROUP —

KGl GETHING FORMATION: conglomerate, carbonaceous sandstone and shale, coal

KCd CADOMIN FORMATION: massive conglomerate

JURASSIC AND CRETACEOUS LOWER CRETACEOUS AND EARLIER

KNs NIKANASSIN FORMATION: fine grained sandstone and carbonaceous shale

BPB DIPMETER ANALYSIS
INTERPRETATION NOTES

1. All plots are correct to the resolution of the plotter used, ie. one hundredth of an inch. Vertical resolution may vary by up to one percent but each plot is correct within itself, the plotted data being dynamically merged with its gridded background
Plots exceeding eight metres in length will be split into multiples thereof, however there is no data loss associated with this subdivision.

2. Rose diagrams are plotted between every major division and are delimited by two bold arrows. For certain replay scales it may be desirable to plot these less frequently; this option is available on request.

3. The borehole tilt and azimuth displayed on the plot are the average values over the whole major division.

4. The replay scale for pads 1, 2 & 3 are designed to give the maximum visual effect over the plotted interval. Replaying shorter sections of the curve will enhance this display.

5. The grid over which the computed dip information is displayed is locally linear. That is to say it is linear between Ø & 1Ø, degrees,1Ø & 2Ø,2Ø & 3Ø etc.

6. The correlation value will vary depending upon the interval size selected. Generally speaking the larger the correlation interval, the lower the value becomes. For this reason a direct comparison of this value for differing correlation intervals is meaningless, quality control being exercised with an appreciation of this effect.

7. For customised control of computed dipmeter analysis the following parameters must be specified:
correlation step and interval(s)
magnetic declination(ie. the difference between true and magnetic North)
search angle(s)
depth range(s)
replay scale(s)
the frequency for rose diagrams
(quality control is exercised in accordance with the correlation interval used,
alternatively all correlations may be displayed on request)

The following information is a listing of ALL the output from BPB's dipmeter analysis. The data is subdivided into three consecutive sets of data readings, being read from left to right. Below is a full description of each data item:

DEPTH	the depth corresponding to the centre of the correlation interval
CALIPER	the average borehole caliper recorded over the correlation interval
HOLE DRIFT	the average borehole deviation from vertical over the correlation interval
HOLE AZIMUTH	the average borehole azimuth over the correlation interval in degrees East of true North
DIP ANGLE	the computed formation dip in degrees, from the horizontal plane
DIP AZIMUTH	the formation azimuth in degrees East from true North
CORRELATION	a measure of the reliability of the computed result. This parameter is also used in the visual display to determine the quality of result

Further recorrelations over any step & interval size are available on any scale over any section of the log. Alternative methods of presentation, or analysis may be made available on request.

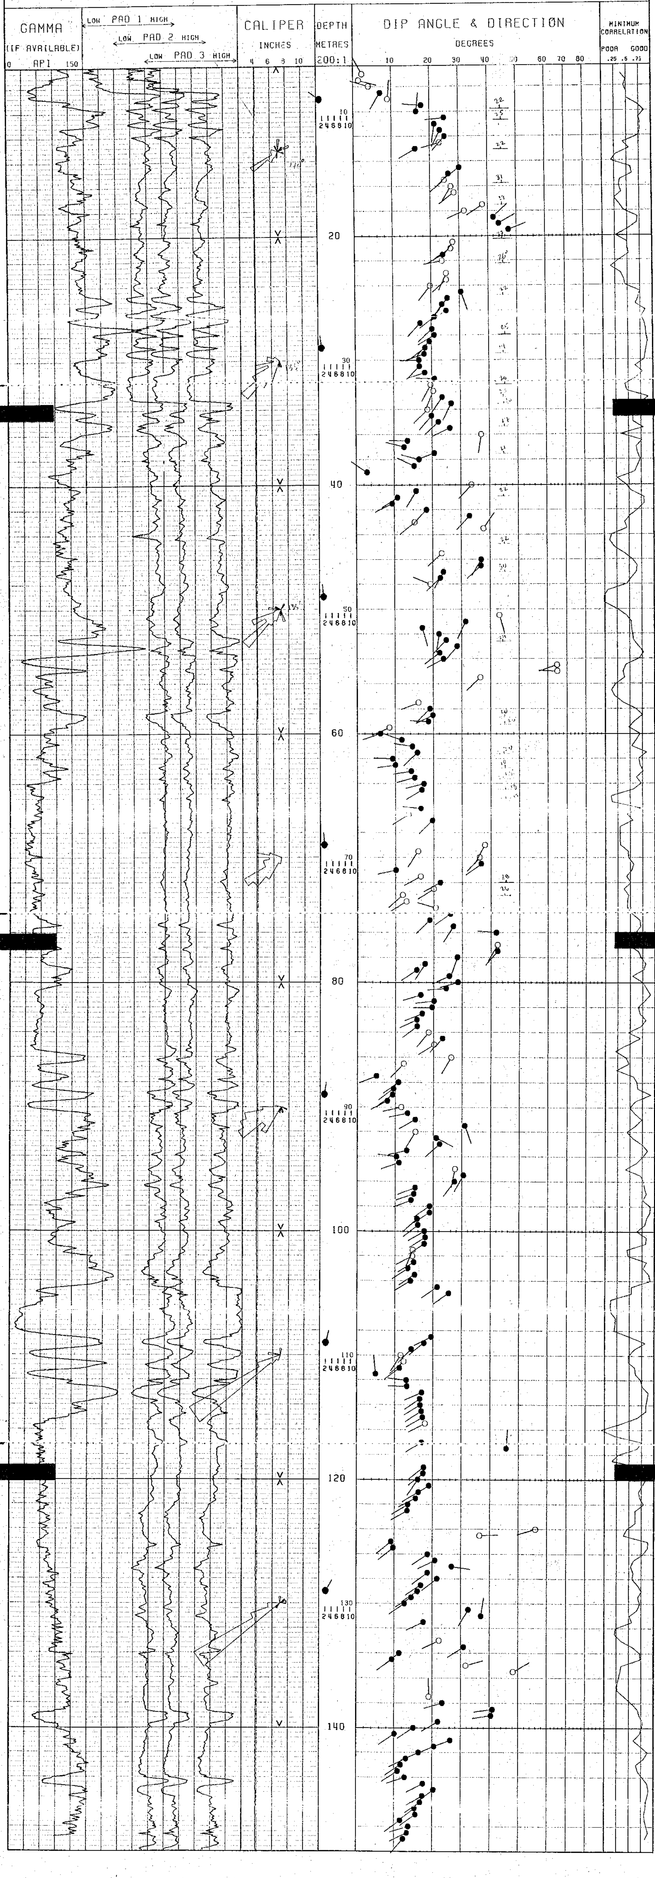
INTERPRETATION PARAMETERS

STEP 0.50M.
INTERVAL 1.00M.
SEARCH ANGLE 60.
DECLINATION 24.0 EAST
DEPTH RANGE 6.31 - 150.00M.
DATE PROCESSED 04-AUG-87

AVERAGE BOREHOLE DEVIATION & DIRECTION
ANNOTATED EVERY 20.0M.

DIPDIAGRAMS SEGMENTED EVERY TEN DEGREES.
.1" RADIUS PER DIP MARKER DISPLAYED

LEGEND:
GOOD (>0.50)
FAIR (>0.30)



BPB DIPMETER ANALYSIS
INTERPRETATION NOTES

1. All plots are correct to the resolution of the plotter used, ie. one hundredth of an inch. Vertical resolution may vary by up to one percent but each plot is correct within itself, the plotted data being dynamically merged with its gridded background
Plots exceeding eight metres in length will be split into multiples thereof, however there is no data loss associated with this subdivision.

2. Rose diagrams are plotted between every major division and are delimited by two bold arrows. For certain replay scales it may be desirable to plot these less frequently; this option is available on request.

3. The borehole tilt and azimuth displayed on the plot are the average values over the whole major division.

4. The replay scale for pads 1, 2 & 3 are designed to give the maximum visual effect over the plotted interval. Replaying shorter sections of the curve will enhance this display.

5. The grid over which the computed dip information is displayed is locally linear. That is to say it is linear between Ø & 1Ø, degrees,1Ø & 2Ø,2Ø & 3Ø etc.

6. The correlation value will vary depending upon the interval size selected. Generally speaking the larger the correlation interval, the lower the value becomes. For this reason a direct comparison of this value for differing correlation intervals is meaningless, quality control being exercised with an appreciation of this effect.

7. For customised control of computed dipmeter analysis the following parameters must be specified:
   - correlation step and interval(s)
   - magnetic declination(ie. the difference between true and magnetic North)
   - search angle(s)
   - depth range(s)
   - replay scale(s)
   - the frequency for rose diagrams
   - (quality control is exercised in accordance with the correlation interval used, alternatively all correlations may be displayed on request)

The following information is a listing of ALL the output from BPB's dipmeter analysis. The data is subdivided into three consecutive sets of data readings, being read from left to right. Below is a full description of each data item:

DEPTH	the depth corresponding to the centre of the correlation interval
CALIPER	the average borehole caliper recorded over the correleation interval
HOLE DRIFT	the average borehole deviation from vertical over the correlation interval
HOLE AZIMUTH	the average borehole azimuth over the correlation interval in degrees East of true North
DIP ANGLE	the computed formation dip in degrees, from the horizontal plane
DIP AZIMUTH	the formation azimuth in degrees East from true North
CORRELATION	a measure of the reliability of the computed result. This parameter is also used in the visual display to determine the quality of result

Further recorrelations over any step & interval size are available on any scale over any section of the log. Alternative methods of presentation, or analysis may be made available on request.

BPB VERTICALITY ANALYSIS
INTERPRETATION NOTES

1. All plotted output is automatically scaled to obtain the best visual effect within the physical space available. The maximum scales being 5ØØØØ:1 (metric) & 48ØØØ:1 (imperial), and the minimum 1:1.

2. The analysis is derived by integrating 1Ø cm./6" sampled data down the borehole. However the listing supplied will contain a maximum of 2ØØ points in multiples of 1,2,5,1Ø,2Ø,25,5Ø, or 1ØØ metres/feet depending upon the total range of the analysis. However the analysis is calculated for the entire range of the borehole, and the final borehole position is included in the listing.

3. Computed verticality may only be fully derived in open sections of the borehole, away from the influence of any magnetic media (as the azimuth calculations are derived from three solid state magnetometers). So the analysis will generally begin at the end of the casing, and all borehole positional information will relate to this depth.

4. Up to ten cross-sections may be requested for any borehole to be displayed at any scale (the default scale is that of the cross-section for the entire hole).

5. Borehole positional error is derived assuming the following parameters:

	TILT(degrees)	AZIMUTH(degrees)
Typical Error	+/- Ø.33333	+/- 1Ø.Ø
Maximum Error	+/- Ø.5	+/- 15.Ø

6. Error analysis may be calculated and plotted from the data listing as follows:

   a) Plot the four coordinates from the error listing (based upon zero azimuth error) on a target plot, origin at the start of the analysis.
   b) Describe arcs of +/- 1Ø degrees & +/- 15 degrees (centre at the origin) through the inner and outer points respectively.
   c) Connect the respective arcs together with straight lines to give the typical & maximum borehole positional error.

7. Given below is a full description of the parameters displayed on the ensuing listing:

LOG DEPTH	the depth recorded on the field logs for the borehole
TRUE DEPTH	the true vertical depth corresponding to the above depth, corrected from the start of the analysis
HOLE TILT & AZIMUTH	the SAMPLED borehole orientation
AXIAL COORDINATES	the coordinates North & East from the target origin
POLAR COORDINATES	the polar, or radial, coordinates of the borehole
ERROR COORDINATES	the polar coordinates corresponding to the typical and maximum tilt error

N.B. The reference point for ALL bearing angles on this listing is given at the top of each sheet

BPB VERTICALITY ANALYSIS
INTERPRETATION NOTES

1. All plotted output is automatically scaled to obtain the best visual effect within the physical space available. The maximum scales being 50000:1 (metric) & 48000:1 (imperial), and the minimum 1:1.

2. The analysis is derived by integrating 10 cm./6" sampled data down the borehole. However the listing supplied will contain a maximum of 200 points in multiples of 1,2,5,10,20,25,50, or 100 metres/feet depending upon the total range of the analysis. However the analysis is calculated for the entire range of the borehole, and the final borehole position is included in the listing.

3. Computed verticality may only be fully derived in open sections of the borehole, away from the influence of any magnetic media (as the azimuth calculations are derived from three solid state magnetometers). So the analysis will generally begin at the end of the casing, and all borehole positional information will relate to this depth.

4. Up to ten cross-sections may be requested for any borehole to be displayed at any scale (the default scale is that of the cross-section for the entire hole).

5. Borehole positional error is derived assuming the following parameters:

	TILT(degrees)	AZIMUTH(degrees)
Typical Error	+/- 0.33333	+/- 10.0
Maximum Error	+/- 0.5	+/- 15.0

6. Error analysis may be calculated and plotted from the data listing as follows:

   a) Plot the four coordinates from the error listing (based upon zero azimuth error) on a target plot, origin at the start of the analysis.
   b) Describe arcs of +/- 10 degrees & +/- 15 degrees (centre at the origin) through the inner and outer points respectively.
   c) Connect the respective arcs together with straight lines to give the typical & maximum borehole positional error.

7. Given below is a full description of the parameters displayed on the ensuing listing:

LOG DEPTH	the depth recorded on the field logs for the borehole
TRUE DEPTH	the true vertical depth corresponding to the above depth, corrected from the start of the analysis
HOLE TILT & AZIMUTH	the SAMPLED borehole orientation
AXIAL COORDINATES	the coordinates North & East from the target origin
POLAR COORDINATES	the polar, or radial, coordinates of the borehole
ERROR COORDINATES	the polar coordinates corresponding to the typical and maximum tilt error

N.B. The reference point for ALL bearing angles on this listing is given at the top of each sheet

BPB VERTICALITY ANALYSIS
INTERPRETATION NOTES

1. All plotted output is automatically scaled to obtain the best visual effect within the physical space available. The maximum scales being 5ØØØØ:1 (metric) & 48ØØØ:1 (imperial), and the minimum 1:1.

2. The analysis is derived by integrating 1Ø cm./6" sampled data down the borehole. However the listing supplied will contain a maximum of 2ØØ points in multiples of 1,2,5,1Ø,2Ø,25,5Ø, or 1ØØ metres/feet depending upon the total range of the analysis. However the analysis is calculated for the entire range of the borehole, and the final borehole position is included in the listing.

3. Computed verticality may only be fully derived in open sections of the borehole, away from the influence of any magnetic media (as the azimuth calculations are derived from three solid state magnetometers). So the analysis will generally begin at the end of the casing, and all borehole positional information will relate to this depth.

4. Up to ten cross-sections may be requested for any borehole to be displayed at any scale (the default scale is that of the cross-section for the entire hole).

5. Borehole positional error is derived assuming the following parameters:

	TILT(degrees)	AZIMUTH(degrees)
Typical Error	+/- Ø.33333	+/- 1Ø.Ø
Maximum Error	+/- Ø.5	+/- 15.Ø

6. Error analysis may be calculated and plotted from the data listing as follows:

   a) Plot the four coordinates from the error listing (based upon zero azimuth error) on a target plot, origin at the start of the analysis.
   b) Describe arcs of +/- 1Ø degrees & +/- 15 degrees (centre at the origin) through the inner and outer points respectively.
   c) Connect the respective arcs together with straight lines to give the typical & maximum borehole positional error.

7. Given below is a full description of the parameters displayed on the ensuing listing:

LOG DEPTH	the depth recorded on the field logs for the borehole
TRUE DEPTH	the true vertical depth corresponding to the above depth, corrected from the start of the analysis
HOLE TILT & AZIMUTH	the SAMPLED borehole orientation
AXIAL COORDINATES	the coordinates North & East from the target origin
POLAR COORDINATES	the polar, or radial, coordinates of the borehole
ERROR COORDINATES	the polar coordinates corresponding to the typical and maximum tilt error

N.B. The reference point for All bearing angles on this listing is given at the top of each sheet

BPB VERTICALITY ANALYSIS
INTERPRETATION NOTES

1. All plotted output is automatically scaled to obtain the best visual effect within the physical space available. The maximum scales being 5ØØØØ:1 (metric) & 48ØØØ:1 (imperial), and the minimum 1:1.

2. The analysis is derived by integrating 1Ø cm./6" sampled data down the borehole. However the listing supplied will contain a maximum of 2ØØ points in multiples of 1,2,5,1Ø,2Ø,25,5Ø, or 1ØØ metres/feet depending upon the total range of the analysis. However the analysis is calculated for the entire range of the borehole, and the final borehole position is included in the listing.

3. Computed verticality may only be fully derived in open sections of the borehole, away from the influence of any magnetic media (as the azimuth calculations are derived from three solid state magnetometers). So the analysis will generally begin at the end of the casing, and all borehole positional information will relate to this depth.

4. Up to ten cross-sections may be requested for any borehole to be displayed at any scale (the default scale is that of the cross-section for the entire hole).

5. Borehole positional error is derived assuming the following parameters:

	TILT(degrees)	AZIMUTH(degrees)
Typical Error	+/- Ø.33333	+/- 1Ø.Ø
Maximum Error	+/- Ø.5	+/- 15.Ø

6. Error analysis may be calculated and plotted from the data listing as follows:

   a) Plot the four coordinates from the error listing (based upon zero azimuth error) on a target plot, origin at the start of the analysis.
   b) Describe arcs of +/- 1Ø degrees & +/- 15 degrees (centre at the origin) through the inner and outer points respectively.
   c) Connect the respective arcs together with straight lines to give the typical & maximum borehole positional error.

7. Given below is a full description of the parameters displayed on the ensuing listing:

LOG DEPTH	the depth recorded on the field logs for the borehole
TRUE DEPTH	the true vertical depth corresponding to the above depth, corrected from the start of the analysis
HOLE TILT & AZIMUTH	the SAMPLED borehole orientation
AXIAL COORDINATES	the coordinates North & East from the target origin
POLAR COORDINATES	the polar, or radial, coordinates of the borehole
ERROR COORDINATES	the polar coordinates corresponding to the typical and maximum tilt error

N.B. The reference point for ALL bearing angles on this listing is given at the top of each sheet

QHD-87-Ø12
****

Verticality Data Listing

All co-ordinates with respect to True North
