DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

These claims lie within an area of Slocan sediments intersected by a few dykes of quartz and feldspar porphyry. The sediments are chiefly blocky and banded argillaceous types, but include some limy and also more quartzitic beds. The workings explore 2 or more veins occupying well-defined fissures intersecting the sedimentary rocks. At an elevation of about 5,600 feet on the Home Rule claim, a lower adit 120 feet long drifts on a vein deposit striking N80°E. The vein matter is as much as 10 inches or more wide; it consists essentially of fragments of galena in quartz gangue, with many fragments of wall-rock. Short, narrow lenses of clean galena also occur. About 150 feet above the portal of this adit, another lode outcrops in the bed of a small creek. This vein is composed of 2 feet of brecciated vein matter, however no ore minerals were observed.

HISTORY OF EXPLORATION AND DEVELOPMENT  
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

These two Crown-granted claims are on the north side of Carpenter Creek valley about 2½ miles above Cody. The Home Rule claim was staked in 1895 and the Greenhorn about 1893. Workings comprise several adits and opencuts over a vertical range of about 800 feet, and are chiefly on the Home Rule claim.

According to Cairnes (1935, p. 50): "Work done to 1925 on this property has been mainly prospecting and has, on the whole, provided encouragement for further exploration". Since 1925 the only work recorded was in 1949, following the acquisition of the claims by John R. Kenney. Development at that time consisted of collaring an adit on the Little Jack claim with the object of locating a possible downward extension of a vein indicated in the Greenhorn tunnel 459 feet above. The tunnel was still in overburden, when work stopped in August.
