DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

The host rock is a limestone and quartzite inclusion, several hundred feet long, in a large area of Cretaceous quartz monzonite. The limestone and calcareous quartzite have in places been extremely altered to a mass of garnet, titanite, fluorite, quartz, pyroxene, and scapolite. Molybdenite and some pyrite are sparingly developed, particularly along irregular quartz veins.

HISTORY OF EXPLORATION AND DEVELOPMENT
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

The property is located at about 4,500' elevation on the south side of Fry Creek some 20 km southeast of the north end of Kootenay Lake. Map 236 A identifies this section of the creek as being on the south fork, about 3 miles above the junction with the main creek, now Carney Creek.

The showings were held by D.M. Wadams & associates in the latter half of the 1920's. The workings, possibly trenches, are about 1,000' above creek bottom.
