DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

"Gunning found beryl in some of the pegmatites exposed on the Snowflake Trail a short distance from the railway. The trail follows a creek (shown as Silver Creek on old maps, Woolsey Creek on recent ones) about 2 miles west of Albert Canyon. It has apparently been obliterated by a logging road. The writer found a few small exposures of pegmatite and pieces of float but no beryl and little or no tourmaline. The area is one of sedimentary gneiss and schist, quartzite and granite-gneiss, cut by granite and pegmatite. It is of metallogenic interest that stannite occurs at the Snowflake mine, about 5 miles north of the railroad." (Mulligan, R., 1968).
