DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

Massive Triassic andesites are intruded by irregular stocks and dykes of quartz diorite. The main showing is a shear zone of quartz and altered and silicified volcanic rock, mineralized with pyrite, arsenopyrite, local chalcopyrite, and carrying erratic Au-Ag values.

HISTORY OF EXPLORATION AND DEVELOPMENT
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

The property is located on the north side of Taylor River some 35 km west of Port Alberni; the Morning property (92 F/6, Au 1) adjoins to the east.

The ground was staked in 1974 as the Tay 1-6 claims by F. Milakovich, of Vancouver. A reconnaissance geochemical soil survey (43 samples) and limited bulldozer trenching were carried out by Lou-Mex Mines Limited. Milakovich restaked the property in 1978 as the Tay 1-18 claims (18 units). A geochemical soil survey (258 samples) and an EM survey over 6.75 km in 1979 indicated a number of conductive zones; diamond drilling (454' in 2 holes) failed to cut sulphides.

Dalmation Resources Ltd optioned the property in 1980 and subsequently acquired 100% interest. Work by the company included a ground magnetometer survey over 4.5 km and 89.6 m of diamond drilling in 3 holes in 1980 and a further 436 m in 6 holes in 1983.

Bowes Lyon Resources Ltd and Gladiator Resources Ltd in May 1984 acquired a joint venture option from Dalmation. Drilling in 1984 totalled 1 070 m in 9 holes; the option was given up. In 1985 Dalmation carried out geological mapping, a magnetometer survey over 16 km and soil and rock geochemical surveys. Work by Dalmation in 1988 included a geochemical soil and rock survey (2,700 samples), an induced polarization survey over 11 km, magnetometer and VLF-EM surveys, and 2,800 m of NQ diamond drilling. One of the gold bearing structures is calculated to contain 145,800 tons at 0.063 oz/t Au (Dalmation Resources Ltd., News Release, 9/02/89). A new 350 m long geochemical-geophysical anomaly was outlined where no previous work had been done.
