OWNER OR OPERATOR AND ADDRESS

DESCRIPTION OF DEPOSIT

On the southeast flank of the Tahtsa Range gabbro stock there occurs a number of narrow quartz stringers containing pyrite, chalcopyrite, galena, specular hematite, silver, and some gold. The fractures and veins occur both in the stock and the Hazelton group rocks close to the contact. Strike is N40°E and dip is vertical. The stringers filling the fractures are only 2 to 3 inches wide and discontinuous.

Associated minerals or products of value - **Silver.**

HISTORY OF EXPLORATION AND DEVELOPMENT

The property is located 3 miles north of Tahtsa Lake and 5½ miles west of Mount Sweeney, at 5,800 feet elevation.

The showing was described by Duffell (1959) as the Tahtsa Range Occurrence. The Glory 1-20 claims were held in 1969 by Jason Explorers Ltd. The surface workings were mapped and two trenches totalling 40 feet were cut in bed-rock.

Mineral Resources Branch, Department of Energy, Mines and Resources, Ottawa.
