OWNER OR OPERATOR AND ADDRESS

DESCRIPTION OF DEPOSIT

Along the south shore of Trembleur Lake, in the vicinity of the outlet to Tachie River, there are many quartz veins cutting impure quartzite with thin, argillaceous beds. The rocks have been folded and faulted, and graphitic and quartz-mica schists occur in disturbed zones. Many large pyrite-bearing diorite dykes also cut these rocks. The veins are from 2 to 14 inches wide and contain small amounts of pyrite. A small amount of galena was noted in one vein.
