DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

The country rocks are folded, cherty, Carboniferous quartzites which outcrop over an area of 4½ square miles in this region. The manganese oxides fill small, irregular fractures in the country rock along the wall and bottom of a small gully. The mineral concentration is greatest where there is the most fracturing, and in places small pockets occur which contain ore of reasonable purity. Tertiary volcanics lying north and west of the Carboniferous sediments are stained with manganese oxides.

HISTORY OF EXPLORATION AND DEVELOPMENT  
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

This property is located about 8½ miles northeast of Fort Fraser.

The showings were located and staked by Mr. Godwin & associates, of Fort Fraser, in 1936. Trenching in the vicinity of a gully failed to indicate the presence of an orebody.
