DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

A number of narrow coal seams occur in Tertiary sediments overlain by basalt. They vary in width from 6 to 12 inches, but much shale is mixed with them. The coal is of the lignite variety. The formation in which the coal occurs is not extensive.

HISTORY OF EXPLORATION AND DEVELOPMENT  
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

This occurrence is located in a large railroad cut on the south side of Fraser Lake, about 2 miles from the east end of the lake.

In the summer of 1920 a number of coal leases were staked by T.J. Kettle. A company known as Fraser Lake Collieries, Limited, was incorporated in January 1921 to take over these leases and some development work was done. The company charter was surrendered in 1926.
