DESCRIPTION OF DEPOSIT

Douglas Lay in 1926 described the showing as follows:

" . . . A very feeble mineralization, showing slight copper stains occurring in decomposed sheared andesite, is exposed on the east bank of the creek for about 200 feet at an elevation of 2,105 feet. A sample of the more promising portion showed no values. A piece of siderite taken from another place was found to contain 10 per cent zinc and 3 per cent manganese, these two metals existing presumably as carbonate."
