OWNER OR OPERATOR AND ADDRESS

DESCRIPTION OF DEPOSIT

Sandstones, shales, and carbonaceous shales of the Hazelton group have a general northerly strike and a gentle dip to the west. Several small coal seams are exposed by a small slide along the hillside but at this point the enclosing beds are considerably crumpled and faulted and the coal outcrops are disconnected and discontinuous. The only important showing is part of a coal seam which has a width of from 3 to 4 feet but is faulted at both ends. The coal is soft and crumbly, is much slickensided, and has apparently been partly altered to graphite.

Associated minerals or products of value

HISTORY OF EXPLORATION AND DEVELOPMENT

The Hazelton Creek coal area is on the south side of Hazelton (Cedar) Creek about  $3\frac{1}{2}$  miles west-northwest of Hazelton.
