DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

This molybdenite occurrence was seen in a moraine. The mineral is disseminated in small fragments of altered pyroxenite and in fragments of quartz associated with ferruginous carbonate. The quartz probably came from a nearby vein or veins not more than a few inches wide. A selected sample assayed: molybdenite, 0.70%.

"Molybdenite occurs within felsite veins and to a lesser extent within quartz and pegmatite veins near the contact of the Takla volcanic rocks and the Hogem batholith." (G.E.M., 1972).

HISTORY OF EXPLORATION AND DEVELOPMENT
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

This occurrence is located on the south side of the pass between the headwaters of Dortatelle and Kliyual Creeks at about the 6,000 foot elevation.

The Ringo, Norlen, and Tumble groups were owned by Doug Stelling and Stellac Exploration Ltd. Exploration work during 1972 and 1973 included geological mapping and geochemical soil surveys.
