OWNER OR OPERATOR AND ADDRESS

## DESCRIPTION OF DEPOSIT

Chalcopyrite, bornite, and chalcocite are present in fractures and amygdules in aphanitic red and green basalt lava flows occurring near the middle of the Takla Group section. These rocks are overlain by Upper Triassic brown shales and a volcanoclastic unit. Some scattered copper mineralization was also observed in the shales.

## HISTORY OF EXPLORATION AND DEVELOPMENT

The property is located at elevations of 5,000 to 6,250 feet on the south slope of a ridge 2.5 miles southwest of Sustut Lake.

The Asitka 1-196 claims were held by Wesfrob Mines Limited. In 1973 a geochemical soil survey (287 samples), magnetometer and electromagnetic surveys were carried out. Work during 1974 included a geochemical soil survey (28 samples) over 0.68 line-mile, and 903 feet of diamond drilling in 3 holes on Asitka 125 and 127.
