DESCRIPTION OF DEPOSIT/*DESCRIPTION DU GISEMENT*

Devonian siliceous shale of the Gunsteel Formation is host to a mineralized interval which is baritic at the top and grades down section into interbedded massive pyrite and interbedded laminated pyrite, and black graphitic siliceous shale. Minor zinc and anomalous silver concentrations occur in the baritic massive pyrite facies and minor zinc in the laminated pyrite zones. Drill intersections indicate the mineralized interval is 25 to 30 metres thick, trends northwest and has steep dips to the southwest.

Associated minerals or products *Minéraux ou produits associés* - Lead, silver, barite.

HISTORY OF EXPLORATION AND DEVELOPMENT
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

The deposit is located at about 6,000' elevation at the head of South Gataga River some 135 km northwest of the north end of Williston Lake.

The showings were discovered in 1977 by the Gataga Joint Venture which was organized by Aquitaine Company of Canada Ltd., Chevron Canada Limited, Getty Mining Pacific, Limited, and Welcome North Mines Ltd. Drilling was carried out.
