

NAME OF PROPERTY PINK ROSE (BOLTON)

OBJECT LOCATED-Group of claims.

UNCERTAINTY IN METRES 2,500. Lat. 53°14'36" Long. 128°40'00"

Mining Division Skeena District Range 4 Coast

County Township or Parish

Lot ~~XXXXXXX~~ Range 4

Sec Tp. R.

OWNER OR OPERATOR AND ADDRESS

DESCRIPTION OF DEPOSIT

The mineralization is found in a contact metamorphic development of chalcocite and bornite in an altered schist-limestone inclusion in quartz diorite.

The limestone forms a bed of about 7 feet in width interbedded with chloritic schists, all of which are steeply folded. The contact of the quartz diorite is exceedingly irregular and surrounds the limestone on three sides.

Mineralization is best developed where limestone has been completely altered to garnetite and epidote.

HISTORY OF EXPLORATION AND DEVELOPMENT

The property was formerly known as the Bolton group and was initially located in 1911. It is situated on the north side of Klekane inlet off Graham reach, about 1 mile from the head of the inlet and at an elevation of 2,200 feet.

During 1916-1917 the claims were under option to The Granby Consolidated Mining, Smelting and Power Company, Limited. After considerable development work Granby relinquished their option.

In 1918, J. Leedy, of Seattle, did some prospecting on the group. In 1922 A. McLeod and associates purchased the property. At that time the group consisted of four claims (Copper-Cliff, New Crown, Lily, and Pink Rose) but as the development work continued, the group was expanded and in 1926 consisted of 8 claims: Copper-Cliff, New Crown, Bella, Key, Pink Rose, Last Chance, Last Chance No. 2 and Bonanza. During the period 1922-1930 the main development work included stripping, trenching along veins, and the driving of an adit for 65 feet through granite and schists, and then drifting 30 feet on the vein.

No further development work was reported.
