DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

Map 1136 A indicates the area is underlain by Jurassic and (?) Cretaceous Bowser Group sedimentary rocks. A fine grained aplite dyke about 1 foot wide was noted in the vicinity of the showings. A quartz vein, locally containing calcite and brecciated wall rock, strikes N50°W and dips 55°NE. Its average width is about 30" but in places is over 5' wide. The vein is sparsely mineralized with chalcopryrite, galena, tetrahedrite and sphalerite. A 2-foot channel sample assayed: gold, nil; silver, 0.84 oz/t; lead, 1.06%; zinc, 0.40%.

HISTORY OF EXPLORATION AND DEVELOPMENT
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

The showings are located at about 1,400' elevation on the south side of Egan Creek, a tributary of the Cedar River, some 34 miles north-northwest of Terrace.

The Blue Grouse and Relief claims were owned from 1918 or earlier by O. Wickstrom. The Hunter group of 6 claims, located on the extension of the Blue Grouse vein, was owned by O. Olander and associates, of Terrace. By 1928 the combined property consisted of 7 claims owned by O. Olander, A. Egan and the Broden Bros, of Rosswood. Yearly assessment work in trenches and a 24' vertical shaft was carried out from 1918 until about 1929.
