DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

Map 1136 A indicates the area is underlain by Upper Jurassic and (?) Lower Cretaceous Bowser Group sediments. Three quartz veins range from 6 inches to 3 feet in width, lie roughly 50 feet apart, strike north, and dip from 50 to 70 degrees east. The country rock is comprised of thick beds of volcanic tuffs which dip gently. There is much drift cover and the veins are exposed for less than 100 feet along their strike. The veins are mineralized with pyrite and some chalcopyrite. Channel samples on assay gave less than half an ounce of silver a ton and no gold.

HISTORY OF EXPLORATION AND DEVELOPMENT  
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

The showings are located at 4,000' elevation at the head of Lorne Creek some 26 miles north of Terrace. The September group of 4 claims was owned in the 1930's by August Johnson.
