DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

The showings occur in an area of intrusives of upper Cretaceous and early Tertiary age.

Flakes of molybdenite occur in narrow quartz veinlets in diorite. Although molybdenite is present in only some of the veinlets in a rather limited area, a further mineralized zone under the snow is indicated by the present of molybdenite-bearing float above the showing.

HISTORY OF EXPLORATION AND DEVELOPMENT
 HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

The property is located at approximately 4,000' elevation on the north side of Seven Sisters Peaks, some 37 miles northeast of Terrace. The showings are at the head of what is known locally as Whiskey Creek, about 300' below an area covered by permanent snow.

Twenty claims were located on the showings in 1958 by a group known as the Telkwa Prospector's Club.

Mega Mineral Limited held 96 claims on this mountain in 1967. Reported molybdenum assays of 1.07% and 3.23% MoS₂ may have been from this property.

This ground was held in 1980 by Cassiar Resources Limited as the Fox 1-5 claims, part of a 17 claim (293 unit) property covering Seven Sisters Peaks. A geochemical survey comprising 61 soil and 20 rock samples was carried out over the larger property.
