DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

A strong quartz vein in Triassic (?) andesite strikes north and dips west at 30 degrees. It ranges in width from 8" at its southern exposure to 24" at its northern exposure, a distance of about 250'. The vein carries up to 3 per cent of sulphide, chiefly chalcopryrite, but with a little bornite and pyrite. The chalcopryrite occurs in irregular blebs throughout the quartz and also in short, parallel seams, some of which are half an inch thick and extend for 3 or 4 feet.

Two channel samples were collected for assay. The first, taken across 9 inches, about 30 feet south of the 45-foot tunnel, assayed: gold, none; silver 0.10 ounce a ton; copper, 0.76 per cent. The second, taken across 16 inches, 20 feet from the talus slide at the north end of the vein, assayed: gold, a trace; silver, 0.60 ounce a ton; copper, 0.18 per cent. (Kindle, 1937).

Associated minerals or products - Silver.

HISTORY OF EXPLORATION AND DEVELOPMENT
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

The showing is located at 3,900' elevation on the west side of a basin on the north side of Bornite Mountain, some 15 miles northeast of Terrace.

The Continental group, comprising the Continental, Sunrise, Morning, Sunset and Black Jack claims was owned from 1914 or earlier by the Hamblett Brothers, J.D. Wells and associates. Some further work was reported in 1920. Work done in that period included open cuts and a 45' adit.
