DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

A quartz vein, from 2 to several feet wide, outcrops near the apex of an anticline. The vein, lying at a flat altitude, is more or less conformable to the enclosing argillites. Mineralization consists of zinc blende, galena, pyrite, and some chalcopyrite. Gold and silver enrichment occurred at the outcrop zone, around the eroded apex of the anticline, and along parallel fractures to a shallow depth below.

HISTORY OF EXPLORATION AND DEVELOPMENT  
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

This property is located on Granby Point, about a mile southeast of Anyox.

The Granby Consolidated Mining, Smelting, and Power Co. Ltd. developed the property as a source of silica flux for the company smelter at Anyox. The first production from the property was reported in 1917 and intermittent operations continued until about 1924 when the mine was closed. During the following years the silica needs of the smelter were supplied by Golskeish Mines Ltd. from the Golskeish property at the head of Granby Bay.

The Granby Point property was reopened in April 1929 and operations continued until February 1930 when the mine was again closed. A resampling of the workings revealed gold values of from 0.25 to 1.0 ounces per ton in some pillars and remaining portions of veins. The mine was reopened in May 1933 and production continued until July 31st, 1935, when Granby closed the smelter at Anyox.

The property was sold in November 1935 to the Consolidated Mining & Smelting Company of Canada Ltd. Lessees made several small shipments of ore from the property during the period 1936-38.

HISTORY OF PRODUCTION/HISTORIQUE DE LA PRODUCTION

From 1917-1938, 62,048 tons of silica were shipped from this property. From this ore 5,795 ounces of gold, 196,260 ounces of silver, 173 pounds of copper, and 947 pounds of lead were recovered.
