DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

The property is underlain by steeply dipping, easterly trending Triassic volcanic tuffs and argillites. In the vicinity of the molybdenite showings there is an iron oxide gossan zone about 1½ miles in diameter. Drill cores from this zone contain molybdenite on fracture planes and in quartz stringers.

HISTORY OF EXPLORATION AND DEVELOPMENT
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

This property is located on the north side of the Barrington River, about 36 miles west of Telegraph Creek.

The property was first staked in 1961 as the Sam group of 80 claims by Southwest Potash Corporation on the basis of anomalous molybdenum values in stream sediments. Work by the company during 1962-63 included geochemical sampling, geological mapping, an airborne magnetometer survey over 60 line-miles, and 3,075 feet of diamond drilling in 3 AX-size holes. Traces of molybdenite were reported in all holes. No further work was done by the company and the claims lapsed in 1968.

Messrs. Armstrong, Laus, Reeve, and Stollery restaked the property as the Ang 1-48 claims under the name "Barrington Syndicate". Coronet Mines Ltd. optioned the property in August 1968 and staked the Ang 49-112 claims. An airborne magnetometer survey of the property in September 1968 revealed an anomaly located at the south end of the gossan zone.
