DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

A small plug-shaped body of feldspar porphyry which has been mapped as Sloko Group, Late Cretaceous-Early Tertiary age, intrudes a section of Upper Triassic Stuhini Group volcanic rocks. These rocks are cut by a west-northwest striking shear zone with a vertical to 80° south dip and a strike length of 1,700 metres. Width of the structure is variable and not well defined. Mineralization in outcrop at the eastern end of the structure consists of discontinuous stringers and veins of quartz, and arsenopyrite with minor pyrite, stibnite, galena, sphalerite, chalcopryrite and pyrrhotite. The precious metal content is erratic. Sampling in 1981 returned a high of 0.130 gold and 3.70 silver across a 1.5 metre chip sample.

HISTORY OF EXPLORATION AND DEVELOPMENT
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

The property is located at elevations of 4,000' to 5,500' on the east side of Mount Lester Jones some 12 miles northeast of Tulsequah.

The showings were discovered in 1980 as a result of regional prospecting and silt sampling by Comaplex Resources International Ltd., as operator, and Redfern Resources Ltd. under a 50-50 joint venture agreement of April 1980. The GO 1-3 claims (56 units) were staked on the discovery and surface exposures were sampled.

Dynamic Oil Limited in February 1981 acquired an option to purchase a 20% working interest in the GO claims. Work by Comaplex during the 1981 field season included trenching, bulk sampling, VLF and magnetometer surveys, and 3,190' of diamond drilling in 9 holes; the drilling indicated values sub-economic in grade and/or width.

Associated minerals or products - Silver.
