DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

The ore occurs in the form of bedded veins that conform in a general way to the stratification planes of the enclosing rocks, which here lie almost flat, and consist mainly of the dark, finely textured, clay-shale members of the Jura-Cretaceous Laberge group. The main vein is from 3 to 4 feet in thickness, and is composed chiefly of quartz and stibnite, with also some galena, and includes, as well, varying amounts of intercalated shale.

HISTORY OF EXPLORATION AND DEVELOPMENT
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

This property is located on the west side of Tagish Lake about 8 miles north of Graham Inlet. Two claims, the Lakefront & Antimony were located in about 1899 by Messrs. J. Johnson and C.B. Dickson respectively. Development work consists of a 15 foot long drift adit. The property was reportedly further prospected in 1915.
