Fold axis of minor fold; based on bedding-cleavage intersection.

MOYIE INTRUSIONS
Mafic sills and rare dikes hosted in Kitchener Formation. Olive green, massive to plagioclase argillite and siltite.

Green, beige siltstone, dark grey argillite; dolomitic siltstone.

Remarks on stratigraphic relations within the Middle Proterozoic Era in the study area are presented on Table 1. For a more detailed discussion of stratigraphic relations, see the original Geological Survey of Canada paper, Paper 98-1E.

ACKNOWLEDGMENTS

The geological mapping and data compilation was supported by an MSF grant from the Natural Sciences and Engineering Research Council of Canada (NSERC) and the Geological Survey of Canada (GSC). The authors are grateful to the Ministry of Energy and Mines, British Columbia for granting access to their records and for providing maps and data. Special thanks to G. A. Brown for providing the data for the map and for his assistance in preparing the geological map and the geological description.
