DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

The claims are underlain by massive granite of the Nelson pluton close to its northern edge. Mineralization is associated with a swarm of alkali dykes and a strong, persistent zone of shearing and brecciation which has been traced for over 550 feet and varies in width from 1 foot to over 40 feet. Pyrite, arsenopyrite, and sulphosalts, carrying gold and silver values, occur in fault gouge, quartz, carbonate, and intensely altered granite in the shear zone. A drill hole in 1983 cut 50' averaging 0.22 oz/t Au including a 15.5' section at 0.56 oz/t Au and 1.56 oz/t Ag.
