OWNER OR OPERATOR AND ADDRESS

DESCRIPTION OF DEPOSIT

The property is underlain by phyllites and hornfelsed slates, intruded by felsite, serpentinite, feldspar porphyry, basalt and diorite. The phyllites and sill-like porphyry intrusions strike northwesterly and dip steeply northeast. Basalt, diorite, and trap dykes bear crosscutting relations with the swarm of feldspar porphyry dykes and felsite. Disseminated chalcopyrite, together with minor pyrite and specular hematite, occurs locally in feldspar porphyry.

HISTORY OF EXPLORATION AND DEVELOPMENT

This property is located along the valley of Haylmore Creek which flows northwesterly into the south end of Anderson Lake about 90 miles north-northeast of Vancouver.

Copper mineralization was discovered in the area by E.D. Dodson in 1969 and the Ed group of 143 claims was staked early in 1970. San Doh Copper Mines Ltd. optioned the property in August 1970 and carried out geological mapping, stream sediment sampling and geochemical soil sampling. The company name was changed in October 1970 to Fourbar Mines Ltd.
