DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

The deposit consists of a roughly rectangular body of limonite lying on the sloping hillside, from which 2 long tongues extend. The deposit is bedded and is free of rock fragments. The deposit covers an area of about 403,450 square feet and is thought to have an average depth of at least 5 feet.

HISTORY OF EXPLORATION AND DEVELOPMENT
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

The Chilcotin group is situated on McClure Creek, about a mile from Taseko River, at an elevation of from 6,000 to 6,400 feet.

Some trenching and test-pitting has been done here but not enough to allow an accurate assessment of the tonnage of material available. However MacKenzie, assuming an average depth of 5 feet, estimates the deposit to contain 126,000 tons, averaging about 49% iron. This agrees closely with the 134,375 tons estimated by Crossland (1920, p. 180).
