DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

Near the south end of the ridge east of the confluence of Tenakihi Creek and Osilinka River, an irregular, pod-shaped vein of solid, crystalline galena replaces slightly banded, dense, flat-lying limestone. The galena is exposed for only 3½ feet, and the maximum observed width was 1 foot. It shows a slight banding of coarse- and fine-grained material parallel with the banding of the limestone that it has replaced. The exposure, however, lies in a rusty, badly weathered area of limestone, and the talus on the west side of the ridge contains abundant blocks of nearly pure galena, some of the larger of which approximate the size of a 1-foot cube. Assays of samples from the outcrop and talus from this deposit show a very uniform lead and silver content averaging, silver, 45.9 ounces a ton, and lead, 83.5%. Roots, E.F. 1954).
