DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

Map 23-1970 indicates the area is underlain by Palaeozoic rocks that include granitoid gneiss, gneissic quartz diorite, gneiss and schist. The showings consist of veinlets and irregular scattered bunches of pyrite with some chalcopyrite. A sample across a 10 foot wide of the best mineralization on the Bolton group assayed only a trace of gold, silver, and copper.

The owners claimed an assay of 1.7% tin but samples selected by the owners and assayed by the BC Dept. of Mines showed no values in tin.

HISTORY OF EXPLORATION AND DEVELOPMENT
HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

The property is located at the head of Kildala Arm, some 25 km south-southeast of Kitimat. Two showings have been reported; one is on a point of land that juts into the east side of Kildala River flats, and the other in the east wall of a small creek at about 400' elevation and a mile easterly.

John Bolton & associates, of Kitimat, in the spring of 1928 staked the Kildala and Bolton No. 2 claim groups covering the point of land and extending easterly up hill for about a mile. Work in 1928-29 included trenching and sampling.
