#### DESCRIPTION OF DEPOSIT/DESCRIPTION DU GISEMENT

Goldslide Creek has cut a deep gully through Jurassic Hazelton Group fragmental volcanics into underlying quartz hornblende diorite(Kitsault Intrusives ?) which underlies a large portion of the cirque. Apatite and pyrite are widespread but also concentrated in the mafic-rich phases. Quartz veining and replacement appear to be widespread. Molybdenite occurs in the intrusive.

#### HISTORY OF EXPLORATION AND DEVELOPMENT HISTORIQUE DE L'EXPLORATION ET DE LA MISE EN VALEUR

Goldslide Creek flows down the west side of Red Mountain, towards the Bromley glacier, some 18 km east of Stewart.

Molybdenite mineralization was discovered in the upper cirque area of Goldslide creek on the MoS<sub>2</sub> group (50 claims) owned by prospector J. Berkosha and associates. In 1967 the owners incorporated Erin Exploration Ltd. to hold the property. Work that year included geological mapping, a geochemical soil survey and diamond drilling in 4 holes. The ground was restaked as the Jack claim (16 units).
