NAME OF PROPERTY GALORE CREEK-SOUTHWEST ZONE

OBJECT LOCATED - mineralized zone.

UNCERTAINTY IN METRES 400. Lat. 57°07'20" Long. 131°28'15"

Mining Division Liard District Cassiar

County Township or Parish

Lot Concession or Range

Sec Tp. R.

OWNER OR OPERATOR AND ADDRESS

Stikine Copper Limited.

DESCRIPTION OF DEPOSIT

The Galore Creek deposits occur in highly fractured zones within and adjacent to a complex syenite body that cuts Upper Triassic sedimentary and volcanic rocks. The syenite and the surrounding rocks are intensely altered. The original mafic constituents and feldspars are replaced by hydrothermal biotite, potash feldspar and epidote with minor gypsum and anhydrite, garnet, chlorite and carbonate.

According to Barr (1965), "The copper deposits at Galore Creek share many of the characteristic features common to both the porphyry copper type of mineralization and that of pyrometasomatic deposits. Features common to porphyry copper deposits include the disseminated character of much of the mineralization, and its relationship to hydrothermal biotite and potash feldspar alteration in shattered and brecciated areas. The prevailing linearity, in plan, of the deposits and their proximity to contacts of porphyritic masses with attendant skarn mineral assemblages are features indicative of a pyrometasomatic origin. The relationships of the deposits to intrusive contacts, and

HISTORY OF EXPLORATION AND DEVELOPMENT

The Southwest mineralized zone lies at approximately 2,900 foot elevation some 2,500 feet southwest of the south end of the Central Zone. For the history of the Galore Creek property see Ref. CU 1.
