PROSPECTING REPORT FORM (continued)

B. TECHNICAL REPORT

- One technical report to be completed for each project area.
- **Refer to Program Requirements/Regulations, section 15, 16 and 17.**
- If work was performed on claims a copy of the applicable assessment report may be submitted in lieu of the supporting data (*see* section 16) required with this TECHNICAL REPORT.

Name C.J Ridley Reference Number 97/98 P66

LOCATION/COMMODITIES

Project Area (as listed in Part A) Regional Project MINFILE No. if applicable Ø

Location of Project Area NTS 93 A/2 : 93A/1 Lat _____ Long _____

Description of Location and Access ~ 26 Km. NE of Eagle CK; by way of 6000 rd. to Y then 7000 rd to Art CK. Forest Rd.

Main Commodities Searched For Gold, copper, zinc, lead, silver

Known Mineral Occurrences in Project Area Gold - HEN-DX claims

WORK PERFORMED

1. Conventional Prospecting (area) See report + maps
2. Geological Mapping (hectares/scale) See report maps
3. Geochemical (type and no. of samples) 45 soil samples: 11 silts; 28 ROCKS
4. Geophysical (type and line km) Ø
5. Physical Work (type and amount) (≈ 150 Rx) rock collecting for specimens
6. Drilling (no. holes, size, depth in m, total m) Ø
7. Other (specify) _____

SIGNIFICANT RESULTS

Commodities As, Au Claim Name Art 1-4 claims

Location (show on map) Lat 650,500 E Long 5764,500 N Elevation _____

Best assay/sample type 1950 ppb Au - in rock (Art97:DR4)
see report for further details

Description of mineralization, host rocks, anomalies _____

Supporting data must be submitted with this TECHNICAL REPORT

Information on this form is confidential for one year from the date of receipt subject to the provisions of the *Freedom of Information Act.*

SUMMARY

THE 1997 FIELD SEASON WAS CONDUCTED IN AN AREA APPROXIMATELY 75 KILOMETERS NORTHEAST OF 100 MILE HOUSE. IT IS EASILY ACCESSED BY PAVED AND GRAVEL ROADS.

TWO NEW CLAIM BLOCKS WERE ADDED TO THE MAP SHEET AS A RESULT OF THIS SEASONS WORK. THE ART 1 - 4 WAS STAKED BY D. RIDLEY AS THEY WILL BE ANNEXED TO THE HEN-LEDGE-DL CLAIMS WHICH LIE A SHORT DISTANCE TO THE NORTH. THE ART 1 - 4 CLAIMS COVER GOLD, COPPER, ARSENIC AND ZINC ANOMALIES IN ROCKS AND MULTI-ELEMENT ANOMALIES IN SOILS. THE CELTIC CLAIMS WERE STAKED TO COVER AN OUTCROPPING OF STAUROLITE AND ANDALUSITE SCHIST.

THE DECEPTION CREEK SURVEYS PRODUCED A NEW VALUABLE INSIGHT ON A POSSIBLE SKARN BODY.

THE ONLY OTHER FIND OF ANY SIGNIFICANCE WAS IN THE B0SS CREEK OR 6200 RD AREA. AN OUTCROPPING OF TERTIARY BASALT FLOW CONTAINING PERIDOT/OLIVINE CRYSTALS WAS DETECTED IN THE DITCH BESIDE THE ROAD AND WAS LATER FOUND TO EXTEND INTO THE BORDERING CLEAR-CUT.

A TOTAL OF 47 DAYS WERE SPENT IN THE FIELD WITH THIRTY ONE COMPLETED BY THE AUTHOR AND ANOTHER SIXTEEN BY MY PROSPECTING PARTNER, D. RIDLEY. TWENTY-FOUR ROCK, ELEVEN SILT AND FORTY-FIVE SOIL SAMPLES WERE SENT FOR ANALYSIS. NINETEEN SOILS WERE ALSO COLLECTED BUT NOT YET SENT IN FOR ANALYSIS. A SUITE OF 77 HAND SPECIMENS WERE COLLECTED AND REPRESENT A SAMPLE OF EVERY ROCK OR ALTERATION ASSEMBLAGE ENCOUNTERED.

IN ADDITION TO THE FIELD DAYS MENTIONED ABOVE, SEVERAL DAYS WERE SPENT CHECKING OUT NEW LOGGING ROADS AND LOOKING FOR ANY FRESH ROCK EXPOSURE. THIS TYPE OF ROAD TRAVERSE IS A HIGHLY EFFECTIVE METHOD WHEN USED EARLY IN THE YEAR. IT DETERMINES ROAD CONDITIONS AT HIGHER ELEVATIONS AND IT ELIMINATES CERTAIN AREAS FROM FURTHER STUDY.

IN SUMMARY, THE ART 1-4 IS PERHAPS THE MOST EXCITING FIND AS IT INDICATES POSSIBLE ECONOMIC MINERALIZATION IN THE REGIONAL NORTH/SOUTH FAULT SITUATED NEAR THE CONTACT BETWEEN BLACK PHYLLITES AND THE MORE VOLCANIC ROCKS TO THE WEST.

INTRODUCTION

1997 FIELD RESULTS ARE MOST ENCOURAGING. A NEW MINERALIZED SHOWING WILL BE ADDED TO MINFILE AND TWO SEPARATE EXPOSURES OF INDUSTRIAL MINERALS WERE IDENTIFIED AND MAPPED.

SULPHIDE MINERALIZATION APPEARS TO HOLD THE BEST ECONOMIC PROMISE IN THE RHYO-DACITE ROCKS OF THE ART 1-4 CLAIMS. DECENT VALUES OF ARSENIC AND GOLD HAVE BEEN FOUND IN THE ROCKS. ANOMALOUS VALUES FOR ARSENIC AND MAGNESIUM WERE FOUND TO EXIST IN THE SOILS. THESE CLAIMS WERE STAKED BY THE AUTHORS PARTNER, D. RIDLEY AS THEY WILL BE ADDED TO THE HEN - LEDGE - DL CLAIM BLOCKS.

THE CELTIC CLAIMS WERE STAKED TO COVER A LARGE EXPOSURE OF STAUROLITE /ANDALUSITE SCHIST. THIS OCCURRED AS A DIRECT RESULT OF A VISIT BY REGIONAL DISTRICT GEOLOGIST BOB LANE WHO WAS SOON FOLLOWED BY INDUSTRIAL MINERALS GEOLOGIST GEORGE SIMANDL. THEY PROVIDED VALUABLE GUIDANCE IN CONSIDERING VARIOUS POSSIBILITIES FOR DEVELOPMENT OF THE CLAIMS. DISCUSSIONS WITH GEORGE SIMANDL CONCERNING INDUSTRIAL MINERALS AND GEMS RESULTED IN ONE DAY NOT REPORTED HERE, SPENT INVESTIGATING A SHOWING OF OPAL IN THE TERTIARY SKULL HILL ROCKS OF THE SOUTH CANIM LAKE AREA. UNFORTUNATELY THE QUALITY OF THE OPAL IS QUITE POOR. HOWEVER IT IS DECENT SPECIMEN MATERIAL AND A LOCAL LANDSCAPING BUSINESS IS QUITE INTERESTED IN BOTH THE OPAL AND THE STAUROLITE.

SAMPLING DONE IN THE DECEPTION CREEK AREA PROVIDED VALUABLE INFORMATION ON THE EXISTENCE OF A CALC-SILICATE SKARN. TUNGSTEN ANOMALIES OCCUR IN SILTS ON THE NORTH SIDE OF DECEPTION CREEK AND THE DISCOVERY OF THE SKARN MAKE THIS A VIABLE TARGET FOR MORE EXPLORATION.

THE HENDRIX MOUNTAIN TRAVERSES UNCOVERED NOTHING MORE THAN THE UBIQUITOUS AUGITE PORPHYRY KNOWN TO EXIST IN LARGE PARTS OF THE AREA.

CLEAR-CUTS ADJACENT TO THE HEN-LEDGE-DL CLAIMS WERE PROSPECTED, AND MAPPED WHEN OUTCROP WAS ENCOUNTERED, AS WERE ALL ROADS LEADING TO THEM.

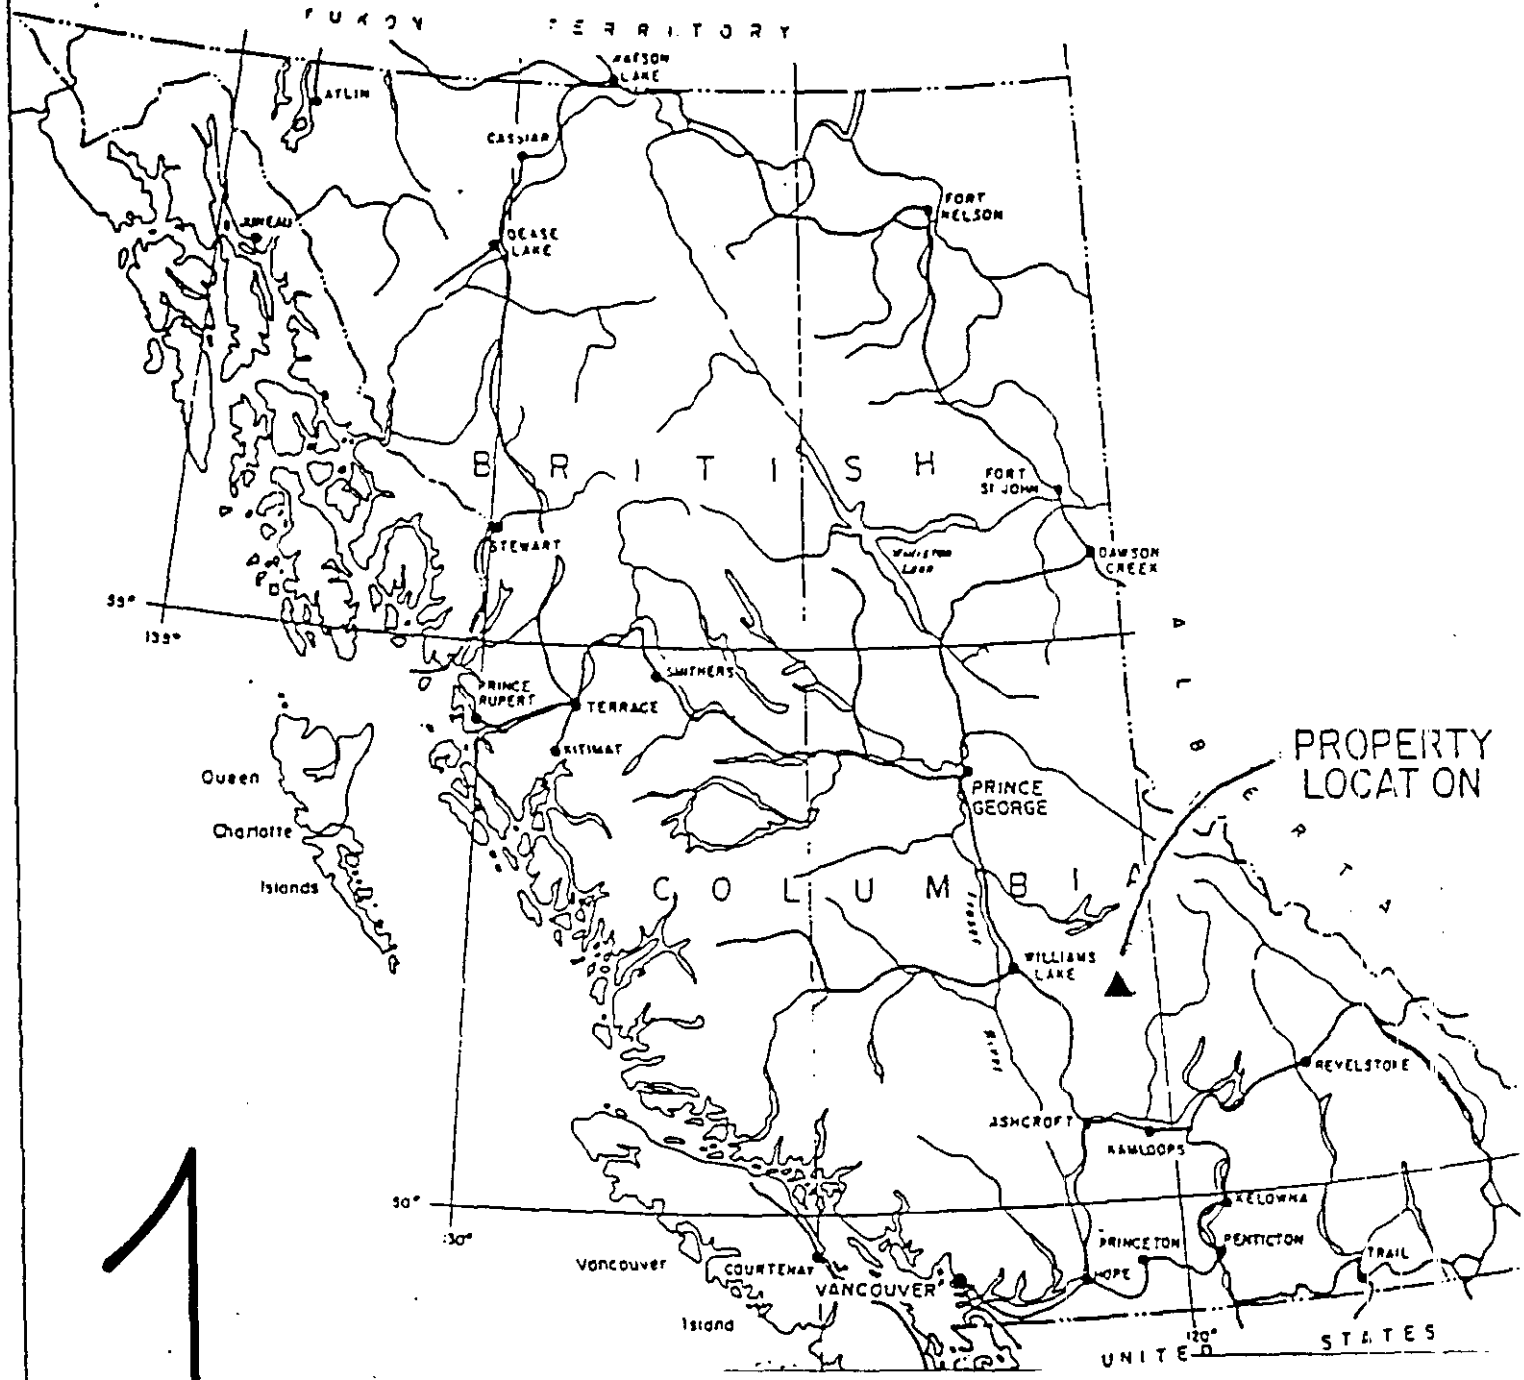
A NEW SHOWING ON THE BURTT CREEK ROAD IN A CHLORITE AND CALCITE RICH VOLCANIC FAULT GOUGE RETURNED NUMBERS OF 1055 ppm ZINC, 143.9 ppm CADMIUM AND 1112 ppm STRONTIUM. THIS GROUND PROVED TO BE VERY CLOSE TO CLAIMS HELD BY FELLOW PROSPECTOR HERB WAHL AND THE AREA WAS ADDED TO HIS CLAIMS.

THE 6200 RD (BOSS CREEK) TRAVERSES REVEALED A NEW OUTCROPPING OF TERTIARY LAVA FLOW, CONTAINING PERIDOT/OLIVINE IN CHRYSOLITE CLASTS.

OVERBURDEN WAS A HINDRANCE IN MANY OF THE EXISTING AND NEW CLEAR-CUTS WHICH WERE EXAMINED DURING THE SURVEY. OUTCROP EXPOSURE AT LOW TO MID- ELEVATIONS IS SCANT, DUE EITHER TO OVERBURDEN OR HEAVY MOSS COVERING. HANDSAMPLES WERE COLLECTED IN ALL AREAS IN ORDER TO ACCUMULATE A REGIONAL SUITE.

THE FOLLOWING REPORT DETAILS WORK DONE IN ALL SECTORS THIS YEAR AND PROVIDES IN DEPTH STUDIES OF THE MAIN AREAS OF MINERALIZATION. THE REGIONAL PROGRAM MAP PROVIDES AND OVERVIEW OF ALL REGIONS COVERED IN THIS YEARS' SURVEY.[1]

[1] SEE FIGURE 6: REGIONAL PROJECT LOCATION MAP



N

GENERAL LOCATION MAP
1997 PROSPECTING SURVEY
CARIBOO MD NTS 93A
FIGURE 1 DEC. 1997 CJR

LOCATION AND ACCESS[1]

THE CENTER OF THE PROJECT AREA IS SITUATED APPROXIMATELY 75 KILOMETERS NORTHEAST OF 100 MILE HOUSE, BC AND IS LOCATED ON QUESNEL LAKE MAP SHEET #93A.

ACCESS FROM HIGHWAY 97 IS VIA THE CANIM-HENDRIX ROAD 58 KILOMETERS TO EAGLE CREEK BRIDGE. THEN BY THE HENDRIX LAKE (6000 RD) TO THE JUNCTION OF THE DECEPTION CREEK (7000 RD). THE 7000 RD IS FOLLOWED FOR ANOTHER 23 KMS TO THE JUNCTION OF THE 7300RD. ACCESS TO THE CELTIC CLAIMS IS GAINED BY TAKING THE 7300 RD FOR 2.3KM.

ACCESS TO THE HEN MAIN SHOWING AND WESTERN PORTION OF THE LEDGE GROUP IS GAINED BY STAYING ON THE 6000 RD TO ITS JUNCTION WITH THE 6300 RD. THIS ROAD BRANCHES MANY TIMES, PROVIDING EXCELLENT ACCESS TO THE CLAIMS AND PERIPHERY OF THE CLAIM BOUNDARIES.

A NETWORK OF FORESTRY AND LOGGING ROADS BRANCHING OFF BOTH THESE MAIN ROADS PROVIDE READY PASSAGE FOR TRUCK OR ATV. THOUGH IT MUST BE NOTED THAT MANY OF THE LESSER ARTERIAL ROADS ARE BEING DECOMMISSIONED.

ELEVATIONS EXTEND FROM 3000' TO APPROXIMATELY 6620'. IN THIS RANGE ALL THE DIVERSE CLASSES OF HERBAGE AND FLORA INDIGENOUS TO THE INTERIOR ARE ENCOUNTERED. CLIMAX OPEN DOUGLAS FIR FORESTS GIVE WAY TO LOWLAND SPRUCE, PINE AND CEDAR AND CONCOMITANT THICKETS OF ALDER, WILLOW, BUCKBRUSH AND RHODODENDRON. ROCK EXPOSURE IS BEST IN RECENT AND PRIOR CLEAR-CUTS AND AT HIGHER ELEVATIONS. OVERBURDEN IS EXTENSIVE IN MOST AREAS AS IS DENSE COVERINGS OF MOSSES AND LICHENS IN HEAVILY FORESTED SECTORS.

REGIONAL GEOLOGY[3]

THE QUESNEL TROUGH OCCUPIES THE EASTERN PORTION OF THE INTERMONTANE BELT ALONG THE TROUGHS' TECTONIC BOUNDARY WITH THE OMINECA. TRIASSIC AND EARLY JURASSIC VOLCANIC ARC AND RELATED VOLCANICLASTIC ROCKS CHARACTERIZE QUESNELLIA AND OVERLIE A THIN, DISCONTINUOUS SLICE OF CROOKED AMPHIBOLITE.[4]

THE TRIASSIC-JURASSIC NICOLA ISLAND ARC-MARGINAL BASIN SEQUENCE IS THE PRINCIPAL ASSEMBLAGE OF QUESNELLIA. THESE ROCKS OCCUPY THE CENTRAL AND SOUTHERN PARTS OF THE NORTHWESTERLY TRENDING BELT AND OUTLINE THE QUESNEL MAGMATIC ARC. ALSO OF IMPORTANCE ARE THE MIDDLE TO LATE TRIASSIC SEDIMENTARY ROCKS WHICH ARE DOMINANTLY FINE-GRAINED AND FORM THE BASAL UNIT OF THE SEQUENCE.

THE NICOLA GROUP IS ASSIGNED TWO MAP UNITS WHICH BREAK DOWN INTO SEPARATE MORE DETAILED ROCK CLASSES. PLAGIOCLASE PYROXENE BASALT (2F, 2G) MAKES UP THE MOST RECENT UNIT FOLLOWED BY ANALCITE PYROXENE BASALT (2E); PYROXENE HORNBLENDE BASALT (2D); POLYLITHIC BRECCIA (2C); BASALT-BRECCIA, TUFF, SANDSTONE (2B); ALKALI OLIVINE

AEROMAGNETOMETER SURVEY

SCALE: 1:250,000

BASALT WACKE (2A); PYROXENE BASALT (1A) AND LASTLY SANDSTONE, SILTSTONE, SHALE AND PHYLLITE. (1)[1]

INTRUSIVE ROCKS ARE REPRESENTED BY THE EARLY JURASSIC TAKOMKANE BATHOLITH AND YOUNGER CRETACEOUS STOCKS AND DIKES. THE BATHOLITH (7) IS COMPOSED OF GREY, MEDIUM GRAINED EQUIGRANULAR TO PORPHYRYTIC QUARTZ DIORITE AND GRANODIORITE.

THE CRETACEOUS ROCKS (8) ARE MEDIUM TO COARSE-GRAINED, HORNBLENDE GRANODIORITE AND QUARTZ MONZONITE; LEUCOCRATIC QUARTZ MONZONITE AND ALASKITE.

AEROMAGNETOMETER SURVEY

A SERIES OF LOW MAGNETOMETER ANOMALIES TRENDING IN A MORE OR LESS EAST/WEST DIRECTION HAVE BEEN INTERPRETED AS OUTLINING A MAJOR STRUCTURAL TREND. MINERALIZATION IS KNOWN TO OCCUR FREQUENTLY ALONG THIS TREND ESPECIALLY IN THE PROJECT STUDY AREA.

THE AREA OF THE ART CLAIMS ARE COVERED BY A NORTHERLY TRENDING LOW WHICH IS REPEATED TO THE NORTH IN AN AREA WEST OF McNEIL LAKE. THIS LOW MAY BE A FURTHER INDICATION OF NORTHWEST FAULTING.

1997 WORK PROGRAM[2]

PROSPECTING, SILT AND SOIL SAMPLING IN CONJUNCTION WITH GEOLOGICAL MAPPING WERE METHODS EMPLOYED DURING THIS FIELD SEASON. TWENTY-EIGHT ROCKS, FORTY-FIVE SOILS AND ELEVEN SILTS WERE COLLECTED AND SENT FOR ANALYSIS. SIXTEEN ADDITIONAL SOILS WERE GATHERED BUT NOT ANALYZED.

IN KEEPING WITH THE REGIONAL CHARACTER OF THIS PROPOSAL MANY TRAVERSES WERE UNDERTAKEN IN SEVERAL DIFFERENT AREAS. IF GROUND COVERED IN THE FIRST SURVEY PROVED INFERTILE NO FURTHER EXPLORATION WAS CARRIED OUT. IF AN AREA DID REVEAL A CERTAIN AMOUNT OF POTENTIAL IT WAS GIVEN CLOSER INSPECTION.

ROAD RECONNAISSANCE SURVEYS WERE BEGUN IN EARLY MAY BOTH BY TRUCK AND ATV WHERE NECESSARY. AS A RESULT OF ONE OF THESE AN AREA ON THE ART CREEK ROAD WAS NOTED FOR FURTHER STUDY. GRANT APPROVAL WAS GIVEN ON **MAY 21, 1997** AND WORK BEGAN SHORTLY THEREAFTER.

THREE AREAS SAW THE MAJORITY OF WORK, THE ART CREEK SHOWING (ART 1-4 CLAIMS) THE CELTIC SHOWING (CELTIC 1-4 CLAIMS) AND HENDRIX MOUNTAIN ENVIRONS.

THE BOSS CREEK PERIDOT SHOWING AND THE DECEPTION CREEK SKARN WERE MAPPED AND/OR SAMPLED. AREAS WHERE MINERAL POTENTIAL WAS DETERMINED SAW ADDITIONAL WORK.

ALL SAMPLE SITES ARE PLOTTED CLEARLY ON MAPS ACCOMPANYING THE REPORT.

ALL WORK WAS CARRIED OUT BY THE AUTHOR OR IN CONJUNCTION WITH MY PARTNER D. RIDLEY. A TOTAL OF FORTY-SEVEN DAYS WERE SPENT IN THE FIELD WITH THIRTY-ONE COMPLETED BY THE AUTHOR.

ART CREEK 1- 4 CLAIMS

I HAVE INCLUDED THE BURTT CREEK TRAVERSES IN WITH THE ART CREEK SECTION AS THE TWO AREAS BORDER ON EACH OTHER.[1] THE BURTT CREEK WORK WAS CURTAILED DUE TO CONFLICT WITH A COMPETING PARTY. HERB WAHL, A FELLOW PROSPECTOR HAS THE **HOTFISH** AND **KINGPIN** CLAIMS AND HAS BEEN DOING FOLLOW UP WORK ON A NUMBER OF NEW SHOWINGS. DURING A VISIT TO OUR HOME HE MENTIONED THAT HE WOULD BE CARRYING OUT FURTHER STAKING IN THE AREA. AS THE SAMPLES I TOOK WERE VERY CLOSE TO HIS PROPOSED STAKING IT WAS DETERMINED BY ME THAT THE RESULTS WOULD BE SHARED WITH HERB AND NO FURTHER WORK WOULD BE DONE CLOSE TO HIS CLAIMS.

TWO SAMPLES WERE TAKEN IN THE BURTT CREEK AREA.

97PAG:CR13 IS A GRAB OF SUBCROP RUBBLE FROM THE ROAD DITCH. IT IS A HIGHLY OXIDIZED AND LIMONITE RICH ALTERED INTRUSIVE. NO SIGNIFICANT VALUES WERE RETURNED FROM IT.

97PAG:CR14 IS A DIFFERENT MATTER. IT IS ALSO A GRAB OF SUBCROP RUBBLE ACROSS THE ROAD FROM CR13. IT IS A HYDROTHERMAL BRECCIA RICH IN CALCIUM AND PYRITE. IT IS ANOMALOUS IN **ZINC** AT **1055 ppm, SILVER** AT **8.6 ppm, STRONTIUM 1112 ppm, CADMIUM** WAS **143.9 ppm** AND **COPPER** WAS VERY SLIGHTLY ANOMALOUS AT **178 ppm.** NO OUTCROP WAS OBSERVED AND NO STRIKE OR DIP OBTAINABLE.

THE **ART CREEK** WORK RESULTED IN STAKING THE ART 1-4 CLAIMS BY MY PARTNER D. RIDLEY WHO PLANS TO ANNEX THEM TO THE NEARBY HEN-LEDGE-DL CLAIMS.

97PAG:CR3 IS A GRAB OF QUARTZ WITH PHYLLITE INCLUSIONS AND WAS ONLY VERY SLIGHTLY ANOMALOUS IN **GOLD** AT **15 ppb**. NO OTHER VALUES OF ANY INTEREST WERE RETURNED FROM IT.

97PAG:CR4 IS A GRAB OF HIGHLY GOSSANED AND MAGNETIC AUGITE PORPHYRY FROM AN OUTCROP STRIKING AT 024' AND DIPPING 72'NE. IT IS ANOMALOUS IN **COPPER** AT **274 ppm, STRONTIUM** AT **3041 ppm** AND **149 ppm CHROMIUM**.

97PAG:CR5 IS A GRAB OF MAFIC AUGITE PORPHYRY OUTCROP SHEAR ZONE. STRIKING AT 144' AND DIPPING 72'SW. IT IS FOLIATED AND PROPILLITICALLY ALTERED AND IS TALC-LIKE TO THE TOUCH. IT RETURNED INTERESTING RESULTS OF **660 ppm NICKEL, 795 ppm CHROMIUM** AND **88 ppb, GOLD**.

97PAG:CR6 IS HIGHLY MAFIC RESEMBLING A GABBRO. IT IS LIMONITE RICH AND MAGNETIC. **NICKEL** IS ANOMALOUS AT **943 ppm**, AS IS **MANGANESE** AT **1083 ppm** AND **CHROMIUM** AT **719 ppm, COBALT** IS ELEVATED AT **103 ppm**. THIS OUTCROP IS TRENDING AT 314' THOUGH NO DIP WAS POSSIBLE.

97PAG:CR7 IS A GRAB OF FAULT BRECCIA HIGHLY SILICIFIED, MAFIC AND CALCITE RICH. THE OUTCROP IT WAS TAKEN FROM STRIKES AT 352' AND DIPS 78'W. CR7 IS ONLY SLIGHTLY ANOMALOUS FOR **COPPER** AT **130 ppm** AND **CALCIUM** AT **1.35 %, VANADIUM** IS ELEVATED AT **138 ppm**.

97PAG:CR8 IS A 45 CENTIMETER WIDE SAMPLE OF ALTERED AUGITE PORPHYRY INTRUDED BY A .45 MILLIMETER WIDE QUARTZ VEIN. IT STRIKES AT 298' AND DIPS 88'NE. VALUES RETURNED FOR IT AT **316 ppm NICKEL, 330 ppm CHROMIUM, 148 ppm COPPER** AND **114 ppm ARSENIC**.

97PAG:CR9 IS APPROXIMATELY 350 METERS NORTHEAST OF CR8. IT IS FROM AN OUTCROP OF AUGITE PORPHYRY BRECCIA WITH EPIDOTE VEINING HIGHLY SILICIFIED AND NON-MAGNETIC. EPIDOTE STOCKWORK VEINING IS PRESENT IN MOST OF THE OUTCROP WHICH STRIKES AT 171' AND DIPS 90'. THOUGH LACKING IN ECONOMIC MINERALS IT ANALYSIS RESULTS SHOWED **269 ppm BARIUM, 144 ppm VANADIUM** AND **139 ppm STRONTIUM, CALCIUM** CONTENT IS **1.00%.**

97PAG:CR10 IS THE SAMPLE THAT FIRST SHOWED THE POTENTIAL OF THE GROUND. IT IS FROM A LARGE OUTCROP EXPOSURE OF RHYO-DACITE WHICH STRIKES AT 180' AND DIPS 86'W. A 0.5 MILLIMETER WIDE QUARTZ VEIN INTRUDES THE ROCK AND WAS INCLUDED IN THE SAMPLE. CLOSE TO THE VEIN THE ROCK MORE RESEMBLES A BRECCIA OF RHYO-DACITE WITH WELL

DEC.'97 GR

FORMED EUHEDRAL PYRITE CRYSTALS AND SOME HEMATITE (?). VALUES FOR THIS SAMPLE WERE **1371 ppm ARSENIC** AND **167 ppb GOLD**. THE **IRON** CONTENT IS ALSO HIGH AT **6. 83 ppm**.

97PAG:CR11 IS TAKEN FROM A MAFIC, SILICIFIED AUGITE PORPHYRY SHEAR STRIKING AT 130' AND DIPPING 90'. IT PROVED TO BE HIGH IN MAFIC MINERALS WITH **NICKEL** CONTENT OF **170 ppm**, **CHROMIUM** IS **221 ppm**, **IRON 5.72%** AND **COPPER** AT **123 ppm**. **BARIUM** WAS ELEVATED AT **122 ppm**.

97PAG:CR12 IS A 30 CENTIMETER GRAB OF SILICIFIED, CALCAREOUS AUGITE PORPHYRY BRECCIA WITH HEAVY LIMONITE ALTERATION. THE OUTCROP TRENDS AT 334' NO DIP MEASUREMENT WAS POSSIBLE. THIS SAMPLE WAS ONLY SLIGHTLY ANOMALOUS FOR **COPPER** AT **161 ppm**, THOUGH **BARIUM, VANADIUM** AND **POTASSIUM** WERE ELEVATED AT **204 ppm, 178 ppm** AND **1.41%** RESPECTIVELY.

97PAG:CR15 LIES APPROXIMATELY 20 METERS NORTHEAST OF CR10. IT IS ALSO FROM AN OUTCROP OF RHYO-DACITE TRENDING 174'. SEVERAL SMALL, MILLIMETER WIDE VEINS OF SPECULAR HEMATITE CUT THE ROCK. VALUES RETURNED FOR THIS SAMPLE WERE **3049 ppm ZINC, 8.9 ppm SILVER, 121 ppm COPPER, 1538 ppm MANGANESE, 280 ppm STRONTIUM, 335.2 ppm CADMIUM, 126 ppm VANADIUM, 7.28% CALCIUM** AND A SNIFF OF **GOLD** AT **13 ppb**.

97PAG:CR16 IS FROM A CONTACT BETWEEN MAFIC AUGITE PORPHYRY AND RHYO-DACITE WHICH TRENDS AT 180'. PYRITE AND HEMATITE WERE NOTED. NO VALUES OF INTEREST WERE RETURNED FROM THIS SAMPLE.

97PAG:CR17 IS A 60 CENTIMETER CHIP OF BLEACHED, ALTERED AND BRECCIATED RHYO-DACITE APPROXIMATELY 5 METERS NORTH OF CR10. THE ROCK RESEMBLES FAULT GAUGE AND IS HEAVILY PYRITIZED WITH UP TO 10% VISIBLE SULPHIDES. THE ROCK STRIKES AT 182' AND DIPS 90', CALCITE IS PRESENT IN ALL FRACTURE FILLINGS. VALUES FOR THIS SAMPLE ARE NOTABLE AT **1753 ppm ARSENIC. 1.2 ppm SILVER** AND ELEVATED **GOLD** OF **56 ppb**.

97PAG:CR18 IS 64 CENTIMETER CHIP OF ALTERED RHYO-DACITE. IT IS CALCAREOUS, BRECCIATED AND HIGHLY PYRITIZED. IT RETURNED VERY HIGH **ARSENIC** VALUES OF **20012 ppm** AND ANOMALOUS **GOLD** OF **120 ppb**.

97PAG:CR19 IS A 72 CENTIMETER CHIP OF THE SHOWING. IT RESAMPLES PART OF CR10. MILLIMETER WIDE CALCITE VEINS CARRY EUHEDRAL PYRITE CRYSTALS INTRUDING THE RHYO-DACITE ROCK. VALUES FOR THIS SAMPLE WERE **1332 ppm ARSENIC, 87 ppb GOLD** AND **101 ppm BARIUM**.

97PAG:CR23 IS A 140 CENTIMETER WIDE SAMPLE OF BOTH THE HANGING WALL AND THE FOOTWALL OF CR18, PART OF WHICH WAS PREVIOUSLY UNDERWATER. HEAVY FRACTURING AND SHEARING HAS TAKEN PLACE IN THE RHYO-DACITE ROCKS. FINE-GRAINED DISSEMINATED PYRITE IS UBIQUITOUS THROUGHOUT THE ROCKS. THE ONLY VALUE OF ECONOMIC INTEREST RETURNED WAS FOR **ARSENIC** AT **1085 ppm, GOLD** REGISTERED AT **40 ppb**.

97PAG:CR24 IS 1.5 METERS SOUTH OF CR17. IT IS A 30 CENTIMETER CHIP OF SERICITE RICH ALTERED RHYOLLITE. AN INTENSE 05 CENTIMETER WIDE ZONE OF HEAVILY PYRITIZED MATERIAL INTRUDES THE ROCK WHICH STRIKES AT 190' AND DIPS AT 70'. **1.5 ppm SILVER** AND **391 ppm ARSENIC** ALONG WITH **31 ppb GOLD** WERE THE ONLY NOTABLE VALUES.

ART97:DR1 IS A SAMPLE TAKEN FROM A SERICITIC SHEAR APPROXIMATELY 20 METERS EAST OF THE BASELINE. HEMATITE-SPHALERITE AND PYRITE ARE FOUND IN A LIGHT GREY RHYODACITE WHICH HAS BEEN BLEACHED BY ALTERATION. THE ZONE IS APPROXIMATELY 40 CENTIMETERS WIDE AND SERICITE FILLS ALL THE FRACTURES. NO ECONOMIC VALUES WERE RETURNED ON THIS SAMPLE.

ART97:DR2 IS A FLOAT SAMPLE TAKEN 15 METERS NW OF DR1. DETERMINED TO BE A BANDED COBBLE OF QUARTZ-CALCITE WITH ALTERED HORNFELSED SEDIMENTS CONTAINING BRIGHT SILVERY PYRITE. **CALCIUM** VALUES FOR THIS SAMPLE WERE HIGHLY ANOMALOUS AT **17.62%**. **STRONTIUM** AND **CHROMIUM** WERE ELEVATED AT **774 ppm** AND **144 ppm** RESPECTIVELY.

ART97:DR3 IS SIMILAR IN CONTENT TO DR2 THOUGH WITH LESS SULPHIDE CONTENT. COMPOSED OF MAFIC VOLCANIC AND HORNFELSED LIGHT BLACK GREY SEDIMENTS IT HAS BEEN PROPYLITICALLY ALTERED AND INTRUDED BY RHYOLITE DYKELETS. **CALCIUM, BORON** AND **STRONTIUM** ARE ALL ELEVATED AT **10.28 %, 298 ppm** AND **359 ppm** APIECE.

DEC.'97 GR

ART97:DR4 IS A GRAB OF HIGHLY FRACTURED AND LIMONITE STAINED ALTERED DIORITE(?). FINE-GRAINED PYRITE AND POSSIBLY ARSENOPYRITE WERE OBSERVED IN THE ROCK. THE SAMPLE WAS TAKEN FROM AN AREA OF RHYO-DACITE OUTCROP WHICH LIES NORTH AND SLIGHTLY WEST OF THE MAIN SHOWINGS APPROXIMATELY FORTY METERS. THIS SAMPLE RETURNED GOOD VALUES FOR GOLD AT **1950 ppb** AND ANOMALOUS VALUES FOR **COPPER** AT **210 ppm**. **ZINC** WAS SLIGHTLY ANOMALOUS AT **164 ppm** AND **VANADIUM** AT **305 ppm**.

OF THE OF THE SILT SAMPLES OBTAINED IN THE AREA TWO RETURNED SLIGHTLY INTERESTING VALUES.

97PAG:CS5 WAS JUST ANOMALOUS IN **SILVER** AT **1.7 ppm, MANGANESE** AT **1154 ppm, 123 ppm VANADIUM** AND **157 ppm BARIUM**.

97PAG:CS6 WAS ANOMALOUS IN **ZINC** AT **109 ppm, 989 ppm** FOR **MANGANESE** AND **113 ppm CHROMIUM**. BOTH THESE SAMPLES WERE TAKEN FROM STREAMS A KILOMETER AND A HALF NORTH AND UPSTREAM OF THE MAIN SHOWINGS.

ART CREEK SOIL GRID[1]

THE ART 1 - 4 LOCATION LINE WAS EMPLOYED AS A BASELINE IN SETTING UP THE SOIL GRID. LINES WERE RUN NORTH AND SOUTH OF THE INITIAL POST AND ONE HUNDRED METERS EAST AND WEST FROM IT. THREE LINES WERE RUN TO THE NORTH WITH AN INTERVAL OF 100 METERS BETWEEN LINE 51N AND LINE 52N WITH AND INTERVAL OF 50 METERS BETWEEN THE BASELINE AND LINE 51N. THE SAME METHOD WAS USED FOR THE LINES RUN TO THE SOUTH OF THE IP. A TOTAL OF 51 SAMPLES WERE COLLECTED IN KRAFT SOIL BAGS, AIR DRIED THEN SENT TO ACME ANALYTICAL LABS IN VANCOUVER. THERE THEY WERE ANALYZED FOR 30 ELEMENT ICP.[2]

RESULTS WERE PLOTTED ON 1:1250 SCALE MAPS AND VALUES FOR COPPER, ZINC, ARSENIC AND BARIUM WERE PLOTTED ON ONE MAP, WHILE VALUES FOR MANGANESE, IRON, CALCIUM AND MAGNESIUM WERE PLOTTED ON ANOTHER.[3]

THESE VALUES WERE ALSO MANIPULATED USING MSEXCEL AND THE CHARTS RENDERED ARE INCLUDED IN THIS REPORT.

OVERALL RESULTS OF THE SOIL PROGRAM WERE SUBTLE. IN THIS INSTANCE MANGANESE WAS USED AS A PATHFINDER MINERAL AND RESULTS FROM THIS MINERAL WERE INCISIVE. MANGANESE IS ANOMALOUS OR ELEVATED FOR OVER SIXTY PERCENT OF ALL SAMPLES.

SIGNIFICANT RESULTS ARE SEEN AT L49N:25+50E; 24+25 - 50E: L49+50N:25+ 25E; AND 24+25 - 75E: *L50+50N:24E TO 25+50E: L51N:24+ 50E: 25+50E: THE HIGHEST* **MANGANESE** RECORDED WAS ON L50+50N: 24+50E AT **20037 ppm.**

MULTI-ELEMENT ANOMALIES OCCUR ON SEVERAL LINES. MOST PREDOMINANT IS THE ANOMALY BETWEEN L49N AND L50N. BEGINNING AT L50N:24E AND EXTENDING TO L50N:24+50E IT TRENDS IN A SOUTHEASTERLY DIRECTION TO L49N:24+25 - 24+60E. VALUES FOR MANGANESE RANGE FORM **254 ppm** TO **1259 ppm**, IRON RICH THE ANOMALY ALSO CONTAINS THE HIGHEST **COPPER** AT **210 ppm**. ZINC VALUES RANGE FROM **69 ppm** TO **154 ppm**. **BARIUM** AND **CALCIUM** MERIT AN MENTION AT RESPECTIVE HIGHS OF **576 ppm** AND **1.55%**. THIS ANOMALY HAS AN OVERALL TREND OF NORTHWEST/SOUTHEAST.

A SINGLE-ELEMENT NON-CONFORMITY IS SEEN WITH THE ARSENIC NUMBERS ON L50+50N:24+ 50E - 25+50E, AND EXTENDING L50N BETWEEN 24+60E AND 24+80E. THIS ONE HAS AN EAST/WEST TREND AND **INCLUDES** THE AREA OF THE **MAIN SHOWING**. A VALUE OF **338 ppm ARSENIC** WAS OBTAINED AT L50+50N:24+75E IT WAS THE HIGHEST RECORDED IN A SOIL.

97-27 pg. 25

A SINGLE - ELEMENT COPPER ANOMALY TRENDS N/S. FROM L51N TO L50N: 24+50E. TWO SPOT ANOMALIES ARE SEEN AT L49+50N: 25+25E AND L51N:26E. AT L49+50N: 24+25E, A **COPPER** VALUE OF **210 ppm** WAS RETURNED. CO-INCIDENTALLY A ROCK SAMPLE TAKEN APPROXIMATELY 10 METERS TO THE SOUTH, **ART97:DR4,** RETURNED VALUES OF **1950 ppb GOLD** AND **210 ppm COPPER.**

BARIUM FORMS A LARGE OPEN ENDED ANOMALY BETWEEN L51N:25E - 24+60E AND EXTENDING THROUGH L50+50N:25E - 24+75E, L50N:24+75E AND OPEN TO THE WEST, L49+50N:24+25E -24E AND L49N:24+50E AND OPEN TO THE WEST AND SOUTH. THIS ANOMALY IS ALSO OPEN TO THE NORTH. ON LINES 51N AND 50+50N AT 25+50E BARIUM FORMS A SMALL ANOMALY ALONG WITH COPPER, ARSENIC, MANGANESE AND IRON. THE HIGHEST VALUE FOR **BARIUM, 1285 ppm** WAS RETURNED FROM A SOIL TAKEN AT L50+50N:24+50E. THE SAMPLE IS DOWNSLOPE OF THE MAIN SHOWINGS, APPROXIMATELY 50 METERS.

A FINAL MENTION SHOULD BE MADE IN RESPECT TO **SILVER**. THE HIGHEST VALUE RETURNED WAS **3.3 ppm** ON L50+50N:BL25E. A SLIGHT TREND CAN BE SEEN TO THE HIGHEST VALUES BEGINNING IN THE NORTH WITH THE AFOREMENTIONED SAMPLE AND TRENDING IN A SOUTHWEST MANNER TO L50N:24+50E WHERE **1.6 ppm** IS REPORTED, THEN TO L49+50N:24+50E WHERE THE SECOND HIGHEST VALUE OF **2.3 ppm** IS SEEN. TWO SPOT ANOMALIES CAN BE SEEN ON L50+50N AND L50N, BOTH AT 24E

SILT SAMPLES IN THE AREA GENERALLY RETURNED INSUFFICIENT DATA TO SUPPORT INTERPRETATION. MAGNESIUM IS ANOMALOUS FOR ALL THE SILTS, HOWEVER ONLY TWO SAMPLES WERE ANOMALOUS FOR OTHER ELEMENTS.

97PAG: CS2 IS HIGHLY ANOMALOUS FOR **MAGNESIUM** AT **1699 ppm** AND BARELY ANOMALOUS FOR **BARIUM** AT **185 ppm**. **97PAG:CS 5** IS HIGHLY ANOMALOUS FOR **MAGNESIUM AT 1154 ppm**, AND IS VARIABLY ANOMALOUS FOR **VANADIUM** AND **BARIUM** AT **123 ppm** AND **157 ppm**.

97PAG: CS3 TAKEN SOUTH OF THE MAIN SHOWING APPROXIMATELY 700 METERS RETURNED **4710** ppm **MAGNESIUM**, A **ZINC** VALUE OF **127 ppm, 124 ppm NICKEL, 152 ppm CHROMIUM** AND ELEVATED **BARIUM**. **97PAG:CS6** TAKEN OVER A KILOMETER NORTH AND WEST OF THE MAIN SHOWING IS SLIGHTLY ANOMALOUS IN **ZINC** AT **109 ppm, CHROMIUM** AT **113 ppm, MAGNESIUM** IS LOWEST IN THIS SAMPLE AT **989 ppm** AND AGAIN **BARIUM** IS ELEVATED.

CELTIC CLAIMS[1]

THE CELTIC 1-4 CLAIMS WERE STAKED TO COVER AN EXPOSURE OF STAUROLITE/ANDALUSITE OCCURRING IN THE SCHIST ROCKS OF THE SNOWSHOE FORMATION.

SEVERAL TRAVERSES WERE RUN IN THE AREA. MAPPING AS WELL AS THE COLLECTION OF HAND SPECIMENS WAS CARRIED OUT WHERE OUTCROP EXPOSURE COULD BE FOUND. AS YET NO OTHER EXPOSURES OF THE STAUROLITE/ANDALUSITE AND/OR GARNET HAVE BEEN FOUND. HOWEVER CLEAR-CUTS PLANNED FOR THE NEXT FEW YEARS MAY AID IN REVEALING FURTHER MATERIAL.

CRYSTALS OF BOTH MINERALS OCCUR IN GREAT QUANTITIES IN THE AREA OF THE CLAIMS WELL-FORMED CRYSTALS CAN BE FOUND BOTH IN FLOAT AND IN OUTCROP, ANDALUSITE CRYSTALS UP TO 5 CENTIMETERS IN LENGTH AND WELL-FORMED STAUROLITE CROSSES ARE ABUNDANT. THOUGH NOT AS COMMON, GARNET OF A DEEP ROSE HUE CAN ALSO BE FOUND.

SURFICIAL ANDALUSITE CYRSTALS ARE WELL WEATHERED SUBTRANSLUCENT TO OPAQUE WITH UNEVEN SUBCONCHOIDAL FRACTURING OF THE PRISMATIC ORTHOHOMBIC CRYSTALS. THE COLOR VARIES FROM WHITISH TO ROSEY-RED.

"ANDALUSITE IS A MEMBER OF THE SILLIMANITE GROUP OF MINERALS CONSISTING OF ANDALUSITE, KYANITE AND SILLIMANITE.

Staurolite /Andalusite Crystals

IT OCCURS IN METAMORPHOSED ROCKS OF CLAY-LIKE COMPOSITION, AS IN THE ANDALUSITE-HORNFELSES IN THERMAL AUREOLES(CONTACT METAMORPHISM), FORMED UNDER CONDITIONS OF HIGH TEMPERATURES AND LOW STRESS, AND IN REGIONAL METAMORPHIC ROCKS, SUCH AS THE ANDALUSITE-SCHISTS.

MOST OF THE ANDALUSITE OCCURS AS THE VARIETY CHIASTOLITE. THE CRYSTALS WHEN CUT OR BROKEN ACROSS EXHIBIT DEFINITE CRUCIFORM GROWTH PATTERNS WHICH ARE DUE TO IMPURITIES ENCLOSED IN THE CRYSTALS DURING THEIR FORMATION.

ALTHOUGH THE FIRST USE OF ANDALUSITE WAS IN THE MANUFACTURE OF CERAMIC SPARK PLUGS, THE BULK OF THE ANDALUSITE PRODUCTION IS NOW USED IN THE REFRACTORIES INDUSTRY, WITH RELATIVELY SMALL QUANTITIES USED IN OTHER APPLICATIONS SUCH AS CERAMICS, ABRASIVES, AND FILLER MATERIALS. ANDALUSITE IS CLOSELY RELATED TO DEVELOPMENTS IN THE STEEL INDUSTRY. SOME APPLICATIONS WHERE ANDALUSITE REFRACTORIES AND CERAMICS ARE USED INCLUDE: STOVE BRICKS AND CHECKERS; DIRECT REDUCTION KILNS; BLAST FURNACE STACK AND RUNNERS; TORPEDO, TRANSFER, AND CASTING LADLES; HOT METAL MIXERS; AND INDUCTION FURNACES IN THE STEEL INDUSTRY.

SOUTH AFRICA HOLDS THE LARGEST KNOWN MINABLE ANDALUSITE DEPOSITS IN THE WORLD, ESTIMATED AT SOME 70 Mt OF KNOWN IN SITU RESERVES, OF WHICH APPROXIMATELY 35 Mt ARE ECONOMICALLY RECOVERABLE USING CURRENT METHODS (HAMMERBECK, 1986).

MORE THAN HALF THE ANDALUSITE PRODUCED IN SOUTH AFRICA IS EXPORTED TO OTHER COUNTRIES. IT IS THEREFORE VERY CLEAR THAT TRANSPORT IS A VERY BIG COST COMPONENT IN THE PRICE OF ANDALUSITE.

STAUROLITE AND ALMANDINE GARNET FREQUENTLY ACCOMPANY THE OCCURRENCE OF ANDALUSITE AND, WHERE PRESENT IN COMMERCIAL QUANTITIES, THEY ARE RECOVERED AND SOLD AS ABRASIVE AGGREGATES."[2]

DARK BROWN TRANSLUCENT TO TRANSPARENT STAUROLITE CRYSTALS PRISMATIC AND PSEUDO-ORTHORHOMBIC IN SHAPE COMMONLY INTERGROWN AT RIGHT ANGLES (TWINNED)AND FORMING A CROSS OCCUR IN VARIOUS SIZES. CRYSTALS OF SEVERAL MILLIMETERS IN LENGTH ARE COMMON.

ALMANDINE GARNET IS MOSTLY SEEN AS DODECAHEDRAL CRYSTALS RANGING IN SIZE FROM MICROSCOPIC TO FIVE MILLIMETERS IN DIAMETER. IT GENERALLY IS FOUND SEPARATELY FROM STAUROLITE AND ANDALUSITE THOUGH IN SIMILAR ROCK.

THESE MINERALS ARE FOUND IN GREY-BLACK QUARTZ-MICA-BIOTITE SCHIST WITH NUMEROUS QUARTZ VEINS AND LENSES. THE ROCK IS WELL FOLIATED AND BANDED IN APPEARANCE.

NONE OF THE MINERALS IS BELIEVED TO BE IN SUFFICIENT QUANTITY AT THIS TIME TO PROVE OF ECONOMIC VALUE. HOWEVER IT IS SUFFICIENT FOR PURPOSES OF ROCK COLLECTION AND STUDY. IT IS THIS LATTER ROUTE THAT THE AUTHOR IS EXPLORING CURRENTLY. STAUROLITE ESPECIALLY IN CROSS FORM DOES NOT OCCUR FREQUENTLY IN NORTH AMERICA THUS MAKING THE SITE A VIABLE COLLECTION AREA.

SPECIMENS HAVE BEEN FORWARDED TO CERTAIN AGENCIES SPECIALIZING IN ROCK COLLECTIONS AND RETAIL MARKET SALES. COMMERCIAL COLLECTING BY THE PUBLIC WILL BE OFFERED AS PART OF A BUSINESS VENTURE PRESENTLY BEING STUDIED BY THE AUTHOR.

DECEPTION CREEK SURVEY AREA[3]

SEGMENTS OF THE DECEPTION CREEK AREA HAD SEEN PRIOR WORK IN THE FORM OF SILT AND ROCK SAMPLING DURING A REGIONAL PROGRAM FOR PIONEER METALS IN THE EARLY 1990'S. NO TARGETS WERE DEFINED AS A RESULT OF THIS WORK. HOWEVER PEGMATITE BODIES AND SUBCROP RUBBLE WERE IDENTIFIED AND NOTED AT THE TIME.

AS A FURTHER RESULT OF TALKS WITH NOTED INDUSTRIAL GEOLOGIST GEORGE SIMANDL CONCERNING LIKELY OCCURRENCES OF PRECIOUS GEMS IN PEGMATITE'S OF SIMILAR ENVIRONMENTS, TWO DAYS WERE SPENT MAPPING OUTCROP, AND SAMPLING STREAMS AND MINERALIZED ROCK.

THE AREA LIES NEAR THE CONTACT OF THE QUESNEL AND BARKERVILLE TERRANES, THE BOUNDARY OF WHICH IS MARKED BY THE EUREKEA THRUST COMPRISED OF MAFIC TO ULTRA-MAFIC METAVOLCANIC ROCKS. IN 1982 THE JEZEBLE CLAIMS WERE STAKED TO EXAMINE THE AREA. THE WORK REVEALED THE PRESENCE OF AN UNMAPPED GRANITIC INTRUSIVE. THE REPORT STATES THAT THE METASEDIMENT PACKAGE VARYS IN COMPOSITION FROM BEING QUARTZ-RICH IN THE WEST THROUGH AN ALLUMINA-RICH PHASE TO SLIGHTLY CALCAREOUS SEDIMENTS IN THE EAST. THE SEDIMENTS ARE STRATIGRAPHICALLY LOWER THAN THE QUARTZ-RICH ONES, WHICH SUGGESTS A REGRESSIVE SEQUENCE. IN LIGHT OF THESE FINDINGS THERE IS A REAL POSSIBLITY OF LIMESTONE BEDS EXISTING LOWER IN THE SEQUENCE. THESE BEDS COULD HOST SKARN DEPOSITS (AR#10641)

DURING PRELIMINARY PROSPECTING IT WAS NOTED THAT CERTAIN ROCKS DISPLAYED SKARN ALTERATION. OUTCROPS OF CALC-SILICATE WELL-MINERALIZED WITH PYRRHOTITE, PYRITE, GARNET AND DIOPSIDE WERE SAMPLED. SPECIMENS OF ACTINOLITE CONTAINING PYROXENE AND GARNET CRYSTALS WERE ALSO TAKEN. SILICIFIED RHYOLLITE OUTCROP MINERALIZED WITH PYRITE IN EUDHEDRAL CRYSTALS WAS MAPPED AND SAMPLED.

97PAG:CR20 IS A SAMPLE OF LIMEY BIOTITE SCHIST CONTAINING PYRITE, PYRHHOTITE AND GARNET STRIKING 253' AND DIPPING 18' SOUTH. THIS SAMPLE RESULTED IN ELEVATED STRONTIUM AND CALCIUM NUMBERS.

97PAG:CR21 IS A SAMPLE OF SILICEOUS FELSIC INTRUSIVE WITH PYRITE WELL DISSEMINATED THROUGHOUT. THE OUTCROP TRENDS 010' WITH SLIGHT WESTERLY DIP. NO ECONOMIC VALUES WERE YIELDED BY THIS SAMPLE.

97PAG:CR22 IS FROM A SILICA RICH INTRUSIVE DYKE STRIKING 172', DIPPING 50 E. PYRITE WAS PRESENT IN MINOR QUANTITIES BUT NO VALUES OF INTEREST WERE RETURNED.

FREE-FLOWING CREEKS WERE SILTED **97PAG:CS8, 9 & 10** WERE SLIGHTLY ELEVATED IN NICKEL BUT NOTICEABLY LACKING IN OTHER ECONOMIC MINERALS.

THOUGH PEGMATITE'S WERE OBSERVED THEY WERE BARREN OF ANY GEM MATERIAL. ROCKS IN THE AREA MANIFEST A DISTINCT EAST/WEST TREND WITH A STRONG WESTERLY DIP.

BOSS CREEK SURVEY AREA[1]

WORK IN THE BOSS CREEK AREA PRIMARILY CONSISTED OF MAPPING AND HAND SAMPLE COLLECTION. THIS AREA WAS GIVEN ATTENTION IN ORDER TO DETERMINE IF THE PROPOSED MINERALIZED FAULT TREND APPARENT ON THE HEN PROPERTY INDEED EXISTED. DURING PROSPECTING AN OUTCROP OF PERIDOT SIMILAR IN CONTENT AND MAKE-UP TO THE OUTCROPS ON TAKOMKANE MOUNTAIN TO THE NORTHWEST WAS IDENTIFIED AND MAPPED.

PERIDOT OR 'EVENING EMERALD', A LIMEY-GREEN TRANSPARENT FORM OF CHRYSOLITE, IS FOUND IN TERTIARY VOLCANIC ROCKS FORMING THE SUMMIT OF TAKOMKANE MOUNTAIN. THE REMARKABLE FEATURE OF THE FIND IS THE QUANTITY OF VOLCANIC BOMBS OCCURRING IN THE AREA. THESE BOMBS CONTAIN THE CHRYSOLITE VARYING CONSIDERABLY IN CHEMICAL COMPOSITION. THE MOST COMMON FORM IS DARK BOTTLE - GREEN IN COLOR. PERIDOT OCCURS IN SOME OF THE BOMBS AS SINGLE CRYSTALS OR MASSES OF CRYSTALS.

THE PERIDOT/OLIVINE OBSERVED HERE IS CONTAINED IN FLOWS. NO BOMBS WERE YET NOTED IN THE AREA.

GRANODIORITES AND DIORITES OF THE TAKOMKANE BATHOLITH AND JURASSIC VOLCANICS PREDOMINATE THE AREA. K-SPAR AND EPIDOTE ALTERATION IS PERVASIVE IN THE FELSIC PYROCLASTIC ROCKS. PREVALENT TREND TO THE ROCKS IS 238'. IT COULD NOT BE CONCLUSIVELY DETERMINED WHETHER OR NOT THE PREVIOUSLY MENTIONED FAULT TREND EXISTS IN THE AREA.

NO SAMPLES WERE TAKEN HERE FOR ANALYSIS AS NO MINERALIZED OUTCROP WAS PERCEIVED.

HENDRIX MOUNTAIN AND DIETRICH CREEK SURVEY AREAS[1]

SEVERAL DAYS WERE SPENT IN CLOSE PROXIMITY TO THE HEN-LEDGE-DL CLAIM BOUNDARIES IN ORDER TO TRACE ANY MINERALIZATION FOUND TO BE TRENDING OFF THE CLAIMS.

97PAG:CR1 IS FROM A CLEAR-CUT TO THE WEST OF THE 6000RD AND NORTH OF THE 6300RD. IT IS A SAMPLE OF AUGITE PORPHYRY THAT HAS BEEN HORNFELSED AND SILICA ENRICHED. **COPPER** IN THIS SAMPLE WAS SLIGHTLY ELEVATED AT **107 ppm**.(CLEAR-CUT #1)

97PAG:CR2 IS TAKEN FROM THE SAME CLEAR-CUT. IT IS OF A VOLCANIC TUFF WITH MINOR PYRITE AND PYRRHOTITE. NO VALUES OF ANY INTEREST WERE RETURNED FOR THIS SAMPLE.

BOTH SAMPLES WERE FROM FLOAT AND THE ONLY OUTCROP FOUND WAS AUGITE PORPHYRY THAT STRIKES 218' AND DIPS 68' TO THE NW. TILL OF TERTIARY ORIGIN DOMINATES THE TERRAIN.

SEVERAL TRAVERSES WERE RUN IN CLEAR-CUTS TO THE NORTH AND SOUTH OF THE CLAIM BOUNDARY AND HAND SAMPLES WERE COLLECTED WITH ANY OUTCROP BEING MAPPED. MINERALIZATION AND/OR ALTERATION WAS SCANT IN THE SECTORS COVERED AND NO SAMPLES WERE OBTAINED FOR ANALYSIS.

TWO SILT SAMPLES WERE TAKEN IN A CLEAR-CUT NORTH OF THE HEN-LEDGE BOUNDARY AND DRAINING AN AREA OF MAINLY BASALTIC TUFFS. MAIN TREND TO THE ROCK IS 096'. **97PAG:CS1** IS SLIGHTLY ELEVATED IN **ZINC** AT **135 ppm. 97PAG:CS4** CONTAINED **2.0 ppm CADMIUM** AND **127 ppm ZINC**. (CLEAR-CUT #2)

HORNFELSED AUGITE PORPHYRY OCCASIONALLY WITH GARNETIFEROUS CONTENT AND TRENDING GENERALLY AT 215' TO 252' WAS MAPPED AND TAKEN FOR HAND SAMPLES IN A CLEAR-CUT NORTH OF THE LEDGE CLAIMS.(CLEAR-CUT #3)

THREE DAYS WERE ALSO SPENT ON MOUNT HENDRIX MAPPING OUTCROP. AS WATER WAS SCARCE ON THE MOUNTAIN ONLY ONE SILT SAMPLE WAS TAKEN **97PAG:CS15**. NO INTERESTING VALUES WERE RETURNED FOR THE SILT. ROCKS ON HENDRIX ARE PREDOMINANTLY AUGITE PORPHYRY - AUGITE-HORNBLENDE PORPHYRY. ANDESITIC AGGLOMERATE WAS ALSO OBSERVED CLOSE TO THE PEAK. NO MINERALIZATION OR ALTERATION WAS NOTED. DOMINANT TREND OF THE ROCKS IS 010' WITH AN EASTERLY DIP.(AREA 1)

SNOW BLANKETED THE DIETRICH CREEK AREA WHEN TRAVERSES WERE FINALLY UNDERTAKEN LIMITING THE ACCESSIBILITY TO OUTCROP.

ARGILLACEOUS SEDIMENTS AND PHYLLITES FORM THE OUTCROPS OBSERVED. NO MINERALIZATION OR ALTERATION WAS OBSERVED. OVERALL TREND HERE IS 320'.(AREA #2)

THE TERTIARY FLOWS ON TAKOMKANE MOUNTAIN CONTAIN PERIDOT/OLIVINE CRYSTAL FORMATIONS AND MINOR GEMSTONES. PART OF THE FLOW HAS BEEN STAKED AND IS INCLUDED IN THE SILVER BOSS CLAIMS BELONGING TO D. RIDLEY. THE AREA IS INCLUDED IN THE PROJECT BOUNDARY. IN AN ATTEMPT TO DISCOVER ADDITIONAL MATERIAL TRAVERSES WERE RUN OFF

THE CLAIMS EXAMINING THE FLOWS ON THE WEST FLANK OF THE SOUTHERN MOST CONE. NUMEROUS BOMBS CONTAINING CHRYSOLITE/OLIVINE WERE FOUND THOUGH MUCH WORK IS NEEDED TO FREE THE CRYSTALS FROM THE ROCK. SAMPLES OF THE PERIDOT HAVE BEEN SHOWN TO LOCAL MERCHANTS INTERESTED IN ROCKS AND MINERALS FROM NEARBY LOCALES. (AREA #3)[1]

CONCLUSIONS AND RECOMMENDATIONS

THE 1997 FIELD SEASON RESULTED IN THE IDENTIFICATION OF A NEW GOLD SHOWING AND THE CATALOGING OF TWO NEW INDUSTRIAL MINERAL SITES.

- A ZONE OF STRUCTURALLY CONTROLLED mineralization WAS DISCOVERED IN THE ART CREEK AREA. THE ART SHOWING CONSISTS OF PYRITE-ARSENOPYRITE MINERALIZATION ASSOCIATED WITH A KAOLIN-SERICITE ALTERED FAULT AT THE CONTACT BETWEEN RHYO-DACITE AND BASALT IN CLOSE PROXIMITY TO A SMALL, PARTLY UN-ROOFED, INTRUSION OF HORNBLENDE-BIOTITE GRANODIORITE. THE FAULT CAN BE TRACED AS STRONG LINEAMENTS ON AIR PHOTOS FOR AT LEAST 10 KILOMETERS. HIGH ARSENIC AND ELEVATED GOLD, ZINC AND CADMIUM MAKE THIS AREA A VIABLE TARGET FOR FURTHER EXPLORATION. A SILT SAMPLE FROM McKINLEY CREEK TAKEN DURING THE 1980'S RETURNED 260 ppb GOLD. THE SAMPLE SITE IS APPROXIMATELY FIVE KILOMETERS NORTH AND ON STRIKE WITH THE ART SHOWING.
- THOUGH SOIL RESULTS AT THE ART SHOWING WERE SPOTTY THEY DID AID IN DELINEATING TWO INTERESTING ANOMALOUS ZONES WHICH ARE COINCIDENT WITH THE MINERALIZED SHOWING.
    - FURTHER GRASS-ROOTS PROSPECTING ON AN EXTENDED SOIL GRID CONSISTING OF ROCK SAMPLING AND A GEOPHYSICAL SURVEY MAY HELP TO UNCOVER AN EXTENSION OF THE MINERALIZED ZONE.
- THE CELTIC STAUROLITE/ANDALUSITE SHOWING THOUGH NOT OF ECONOMIC INTEREST AT PRESENT DUE TO THE LOW QUALITY OF THE INDUSTRIAL MINERALS IS AN INTERESTING *DISCOVERY IN LIGHT OF THE INCREASING DEMAND FOR ROCK HOUNDING LOCATIONS. THE* FACT THAT STAUROLITE IS NOT COMMONLY FOUND IN OUR PROVINCE IN SUCH GOOD CRYSTAL FORM ENFORCES ITS VIABILITY AS A COLLECTION SITE.
    - ADDITIONAL TRAVERSES ARE NEEDED TO EXPLORE THE POSSIBILITY OF MORE OUTCROP IN THE AREA. HOWEVER THE MATERIAL NOW AVAILABLE IS MORE THAN ENOUGH TO ESTABLISH THE CLAIMS AS A FEASIBLE COLLECTION SITE.

[1] See Fig. 6

- THE NEW PERIDOT/OLIVINE SHOWING ON THE 6200 RD (BOSS CREEK) NEEDS MORE EXPLORATION IN ORDER TO UNCOVER POSSIBLE COLLECTABLE MATERIAL. UNLIKE THE SHOWING ON TAKOMKANE MOUNTAIN WHERE CRYSTALS CAN BE EASILY OBTAINED IN LOOSE SURFACE MATERIAL, THE CRYSTALS APPARENT IN THE NEW SHOWING ARE ENCASED IN COMPETENT ROCK MAKING THE EXTRACTION A LENGTHY PROCESS.

    - FURTHER TRAVERSES ARE NEEDED IN ORDER TO DETERMINE IF PYROCLASTIC BOMBS CONTAINING THE MINERALS EXIST IN THE AREA. EXTRACTION OF CRYSTALS WOULD BE GREATLY AIDED IF THIS PROVED TO BE THE CASE.

- THE DECEPTION CREEK AREA BEARS MORE STUDY IN LIGHT OF THE DISCOVERY OF THE CALC-SILICATE BODIES UNCOVERED DURING THIS YEARS PROGRAM. TUNGSTEN SILT ANOMALIES ARE KNOWN TO EXIST IN CREEKS ON THE NORTH SIDE OF DECEPTION CREEK. THESE ANOMALIES AND THE PRESENCE OF SKARN IN THE AREA MAKE IT A VIABLE TARGET FOR FURTHER EXPLORATION OF THE AREA.

    - ROCK AND SILT SAMPLING ON THE NORTH SIDE OF DECEPTION CREEK AND IN CLEAR-CUTS AS YET UNEXAMINED MAY HELP TO UNCOVER FURTHER SKARN MINERALIZATION/ALTERATION IN THE AREA.

ROCK SAMPLE SHEET

Sampler: C J Ridley
Date: Summer/97
Property: 97 PAG
NTS: 92P/15 & 93A/[illegible]

SAMPLE NO.	Sample Width	DESCRIPTION: Rock Type	DESCRIPTION: Alteration	DESCRIPTION: Mineralization	ADDITIONAL OBSERVATIONS	ASSAYS (ppm) Cu	Pb	Zn	As	(ppb) Au
97 PAG CR1	grab	Augite Porph.	Qtz. Hornfelsed	minor Py	GPS: 653455E 5769489N 3406' ELEV. - ? sc/oc - stkwrk Qtz veins; 1st clrct. W of 6300 Rd	107	3	30	7	<2
CR2	comp. grab	Volcanic	silica	minor Py/Po	GPS: 593E 952N 1100m. elev. - s.c. rubble - ? poss. tuff; clrct. W/6300	15	6	15	<2	<2
CR3	grab	Qtz.	—	—	GPS: 663900E 5761810N 4180' elev. - ? sc - Qtz Bldr.; Art CK spur	12	<3	7	<2	15
CR4	grab	Augite Porphyry		minor Py/Po	- 1.25 m. N from CR3 - 024°/72°E; ★ Sr → 3041 ppm	274	18	23	4	8
CR5	3.5m	ultra mafic	chlorite silica	Pyrite	- 20m. NW from CR4/E side of Rd. - 144°/72° S.W.; ★ Ni - 660ppm. CR - 795ppm	66	7	22	7	88
CR6	grab	ultra. mafic			663929E 5762519N - foliation (?) 058° - ? trend 314°; ★ Ni - 943 ppm CR - 719 ppm Co - 103 "	22	<3	31	29	<2
CR7	grab	Fault Breccia	silica calcite	Pyrite	- 50m. N of CR6 663930E 5762932N - 352°/78°W; Art CK.	130	11	67	<2	<2
CR8	4/5cm	Qtz. Vein	—	Pyrite	70m. N from CR7 4295' elev. - 298°/88° NE; Art CK	147	52	92	114	18
CR9	grab	intrusive Breccia	epidote	Pyrite	- N from CR8 - epidote stkwrk - 171°/90°; Art CK	23	5	33	<2	4
CR10	grab	Rhyo-dacite		Pyrite → 3%	- N of CR9 - 180°/86°W; * .5m wide Qtz vein cuts RX.	11	20	7	1371	167
CR11	30cm	Augite Porphyry	chlorite calcite	Pyrite	- N of CR11 - 130°/90°	123	16	50	10	3
CR12	30cm	Breccia	chlorite calcite	2% Pyrite	@ 1030m. from Y - fracture zone - trend 334°; Art CK log spur	161	3	53	38	3
CR13	comp. grab	Volcanic	calcite chlorite Diopside	Pyrite	2.9 miles (Bike) from 7000 rd.; Burtt CK. Rd.	14	<3	23	24	<1
CR14	grab	Fault Gouge	chlorite calcite silica		- across rd. from CR13; Sr: 1112 (ppm) Cd: 143.9 (ppm); Burtt CK Rd	178	25	1055	36	6
CR15	40cm.	Rhyo-dacite	hematite		@ 20m. N.E. from CR10 [illegible] - oc (1m x .5m); cd: 335.2 (ppm); ART CK. Rd	121	11	3040	81	12
