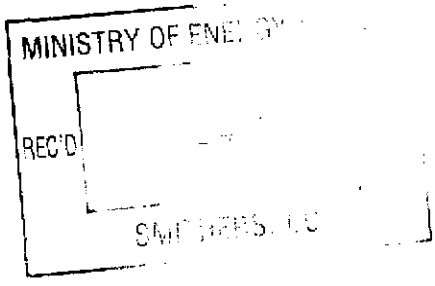
PROSPECTORS ASSISTANCE PROGRAM

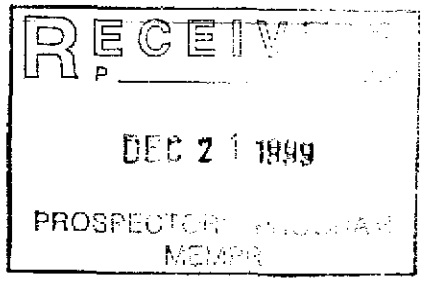
MINISTRY OF ENERGY AND MINES

GEOLOGICAL SURVEY BRANCH

PROGRAM YEAR:	1999/2000
REPORT #:	PAP 99-4
NAME:	RUPERT SEEL

British Columbia
Prospectors Assistance Program





Prospectors Reports
Reference #: 99/00 P5

Submitted By: Rupert R. Seel
Date Submitted: December 20, 1999

Table of Contents

Purpose:

To prospect in the area of geological features which contains several known mineral deposits.

Introduction:

The area of interest is immediately north and east of Troitsa Peak in the Whitesail Ranges of mountains and mainly south of Tahsta Reach of the Nechako Reservoir (NTS 93E/11 & 93E/10). Access to the area is by recently built logging roads and helicopter.

The higher elevations of the range have been extensively prospected and geologically mapped, however the lower areas have much glacial drift and have few outcrops. Of particular interest is a geographically lower area between the foot of the Whitesail Range Mountains and Tahtsa Reach, which contains several known mineral occurrences and intrusive rocks.

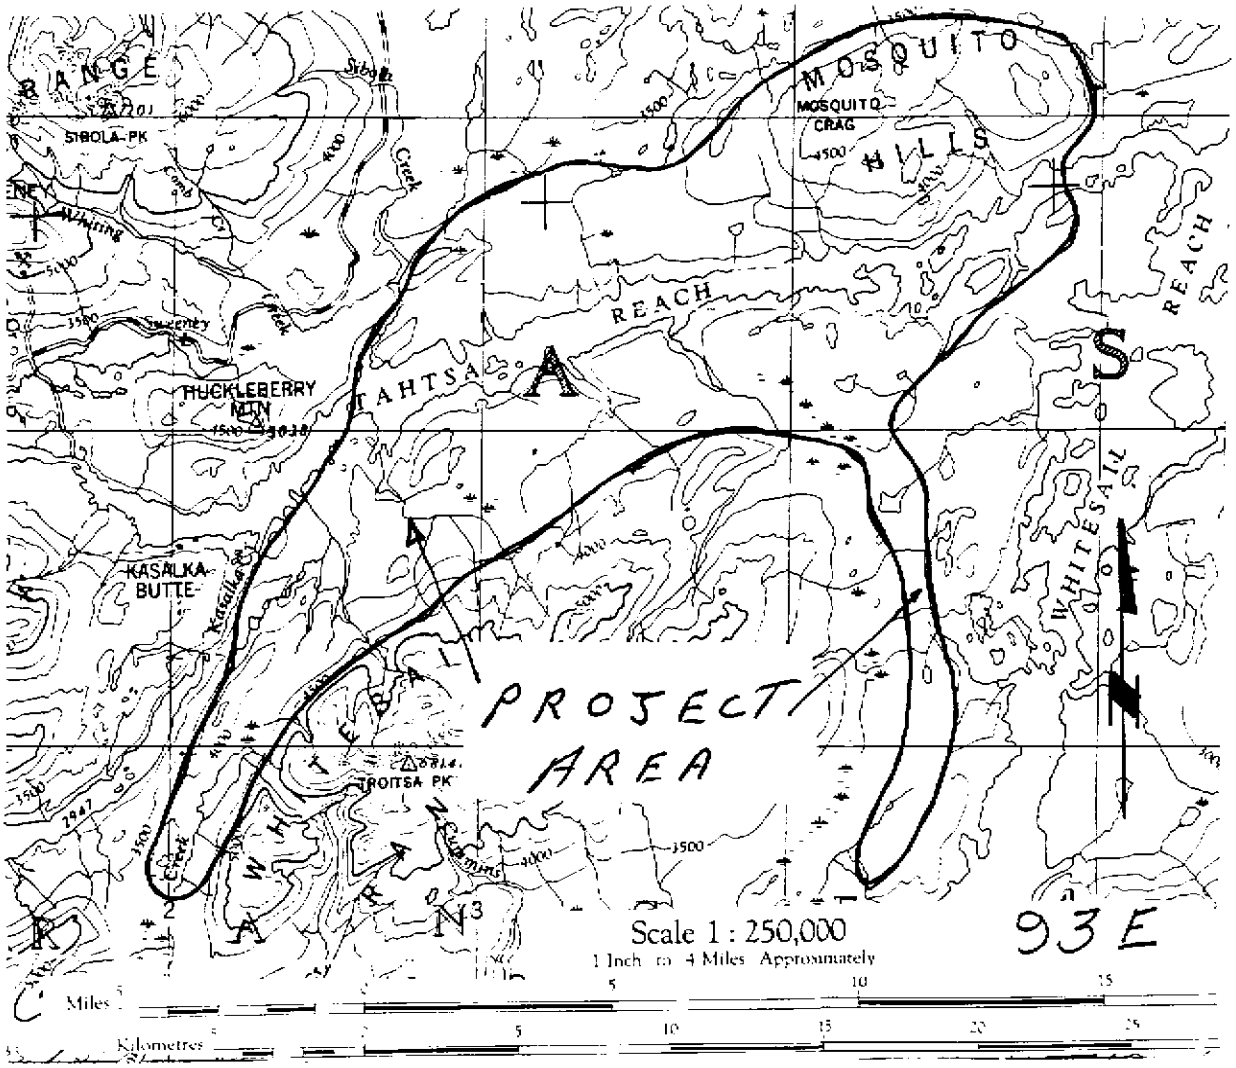


Figure 1: *Location of prospecting area*

This feature trends northeast and lays to the north of the Whitesail mountains. The writer prospected this area between previously known mineral occurrences taking soil, silt, and rock samples, mainly at four locations, Site #1 - #4.

Method:

The area was traversed by truck on new logging roads, by boat, all terrain vehicle and on foot. Soil, silt and rock samples were taken for analysis. Sample locations were flagged with survey ribbons having written sample numbers. Locations of sites were plotted on a 1:50,000 scale map (see Sample Location Map, Figure #2).

Silt samples were taken from areas where the bedrock was probably nearby or the glacial overburden was thought to be shallow. Soil samples for the "B" horizon were collected where the bedrock was close to the surface. Both silts and soil samples were collected in craft paper bags, dried at room temperature and then sent to the lab for analysis.

Rock outcrops with pyrite and/or limonite mineralization were sampled, especially rocks that seemed to be from gossans or had much limonite alteration.

All samples on map were sent to TSL Assayers for multi-element ICP analysis (see Appendix 2) using TSL Assayers standard technique of sample preparation.

Project Area:

Site #1 was selected based on a sample taken in at rock pit contained 475ppm of Arsenic. A grid was layed out in a south west direction.

Site #2 was based on high VLF-EM response reported in 10168 assessment report. This same area, with a high magnetic reading taken in 1984 by Lansdowne. Grid is based on Lansdowne grid.

Site #3 was based on a high magnetic high reading of over 1000. Grid is based on Lansdowne work of 1984.

Site #4 is an area selected for high VLF-EM response survey. 4 lines were run in a West to East direction.

Conclusion:

Site #1:

38 soil samples taken, only those taken at the north end showed any value in Au (see appendix 1). This is most likely due to the bed rock being near the surface. Bed rock in this area is sedimentary.

Site #2:

A total of 51 soil samples were taken. Grid lines run across the slope East to West. High in Au of 202ppb, Ag 1.8ppm, Zn 473ppm (see appendix 1). The only bed rock found was in the small creeks on the north edge of the site. This bed rock is volcanic and cherts with veinlets of pyrite, maybe a fault zone. There is a possibility that this anomaly could be contained to the East, as the area is covered by an old slide.

Site #3:

A total of 23 soil samples were taken (see appendix 1). This area in on the same grid as Site #2. No values are indicated this may be due to depth of overburden.

Site #4:

A total of 29 soil samples were taken (see appendix 1). These grid lines were run across the slope in a westerly direction. There were low values in Cu; 65ppm and Ag; 1.0ppm. No bed rock was found but there was sedimentary float located and prospecting higher up the ridge was volcanics, this area may be on or near a contract zone.

Reconnaissance:

A reconnaissance of The Shelford Hills showed a silt sample analysis of Au 30ppm. This is an interesting area.

A trip to the Whitesail area was of little value, most rock viewed was volcanics.

The area East of Whiteing Creek is interesting due to the mixed rock types.

Mosquito Hills was not very interesting, as most rock was sedimentary, on the North and West slopes. Only on the South side is there an intrusion of granodiorite.

PROSPECTORS ASSISTANCE PROGRAM
PROSPECTING REPORT FORM (continued)

B. TECHNICAL REPORT

- One technical report to be completed for each project area.
- **Refer to Program Requirements/Regulations 15 to 17, page 6.**
- If work was performed on claims a copy of the applicable assessment report may be submitted in lieu of the supporting data (see section 16) required with this TECHNICAL REPORT.

Name RUPERT SEEL Reference Number 99/00 PS

LOCATION/COMMODITIES

Project Area (as listed in Part A) WHITE SAIL MINFILE No. if applicable _____

Location of Project Area NTS 93E Lat _____ Long _____

Description of Location and Access TRUCK TO TAHTSA REACH, BOAT TO KASALKA CREEK, THEN BY ATV. WEST END OF AREA BY FIX WING AIR

Main Commodities Searched For GOLD COPPER

Known Mineral Occurrences in Project Area OX LAKE, HUCKLEBERRY MINE

WORK PERFORMED

1. Conventional Prospecting (area) 50 KM
2. Geological Mapping (hectares/scale) NIL
3. Geochemical (type and no. of samples) 156 SOILS SAMPLES
4. Geophysical (type and line km) _____
5. Physical Work (type and amount) 1 KM OF TRAIL CUT
6. Drilling (no. holes, size, depth in m, total m) _____
7. Other (specify) _____
