SURFICIAL GEOLOGY OF NORTHERN VANCOUVER ISLAND AREA

NTS 92 U5, 6, 11 & 12

By P. T. Bobrowsky (P.Geo.)

Scale 1:100 000

For an overview of the Quaternary geology of the Northern Vancouver Island area, please refer to the following reports: Bobrowsky and Meldrum (1994a), Huntley and Bobrowsky (1995a), Bobrowsky *et al.* (1995). Map represents Huntley and Bobrowsky (1995b) 8:50 000 scale map by Bobrowsky and Meldrum (1994b, 1994c, 1994d), Chatterton (1980), Huntley and Bobrowsky (1995c), and Huntley and Bobrowsky (1995d) 1:50 000 scale map by Bobrowsky and Meldrum (1994e, 1994f), Chatterton (1980), Huntley and Bobrowsky (1995e), followed by ground tracing in areas indicated on original maps.

LEGEND

QUATERNARY

HOLOCENE - POST PORT MONEILL GLACIATION

- A **ANTHROPOGENIC DEPOSITS** culturally disturbed and modified terrain.
- O **ORGANIC DEPOSITS** peat, muck and other vegetative materials at least 40 to 60 cm thick and often several metres thick, formed by the accumulation and decay of vegetative materials in depressions or level areas including bogs, fens and swamps.
- E **EOLIAN DEPOSITS** well-sorted, medium to fine sand and coarse silt, transported and deposited by wind action; generally > 1 m thick, occasionally forming dunes.
- COLLUVIAL DEPOSITS: clay and matrix-supported diamicton or rubble resulting from the alteration of bedrock and associated debris, well-sorted to well-sorted, reworked and transported by gravitational processes including creep, sliding, debris flow, avalanching, topple and rockfall.
- Ca **Colluvial fan deposits** diamicton or rubble; > 1 m thick.
- Cb **Colluvial talus deposits** diamicton or rubble; > 1 m thick.
- Cc **Colluvial apron and debris** diamicton or rubble; > 1 m thick, generally resulting from slope failures and localized movement including debris avalanches, debris slides, debris torrents and mudflows.
- Cv **Colluvial veneer deposits** diamicton or rubble; < 1 m thick and/or discontinuous.

ALLUVIAL DEPOSITS

- Ap **Floodplain deposits** cobble to pebble gravel, including minor sand, silt and clay; > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- At **Alluvial terrace deposits** cobble to pebble gravel, including minor sand, silt and clay; > 1 m thick, step-like topography, commonly marginal to channels and floodplains, well drained areas not subject to stream flooding.
- Af **Alluvial fan deposits** cobble to pebble gravel, including sand, silt and clay and diamicton deposits; > 1 m thick, well sorted to massive, includes areas subject to debris flows, flooding and stream avulsion.

WISCONSINAN - PORT MONEILL GLACIATION

- GLACIOFLUVIAL DEPOSITS: well stratified sand, silt and clay, including minor gravel and diamicton deposited in lakes adjacent to glacial ice; slump structures, irregular topography and kettles indicative of collapse from melting of buried ice commonly present.
- L0a **Glaciolacustrine basket** sand, silt and clay; > 1 m thick.
- L0c **Glaciolacustrine veneer** sand, silt and clay; < 1 m thick.
- GLACIOMARINE DEPOSITS: well stratified silt and clay, including minor sand, gravel and diamicton deposited in ice-marginal depositional environments; topographic and level topography is present.
- W **Glaciomarine sediments** silt and clay, minor sand and gravel; > 1 m thick.

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand, silt and clay; > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.

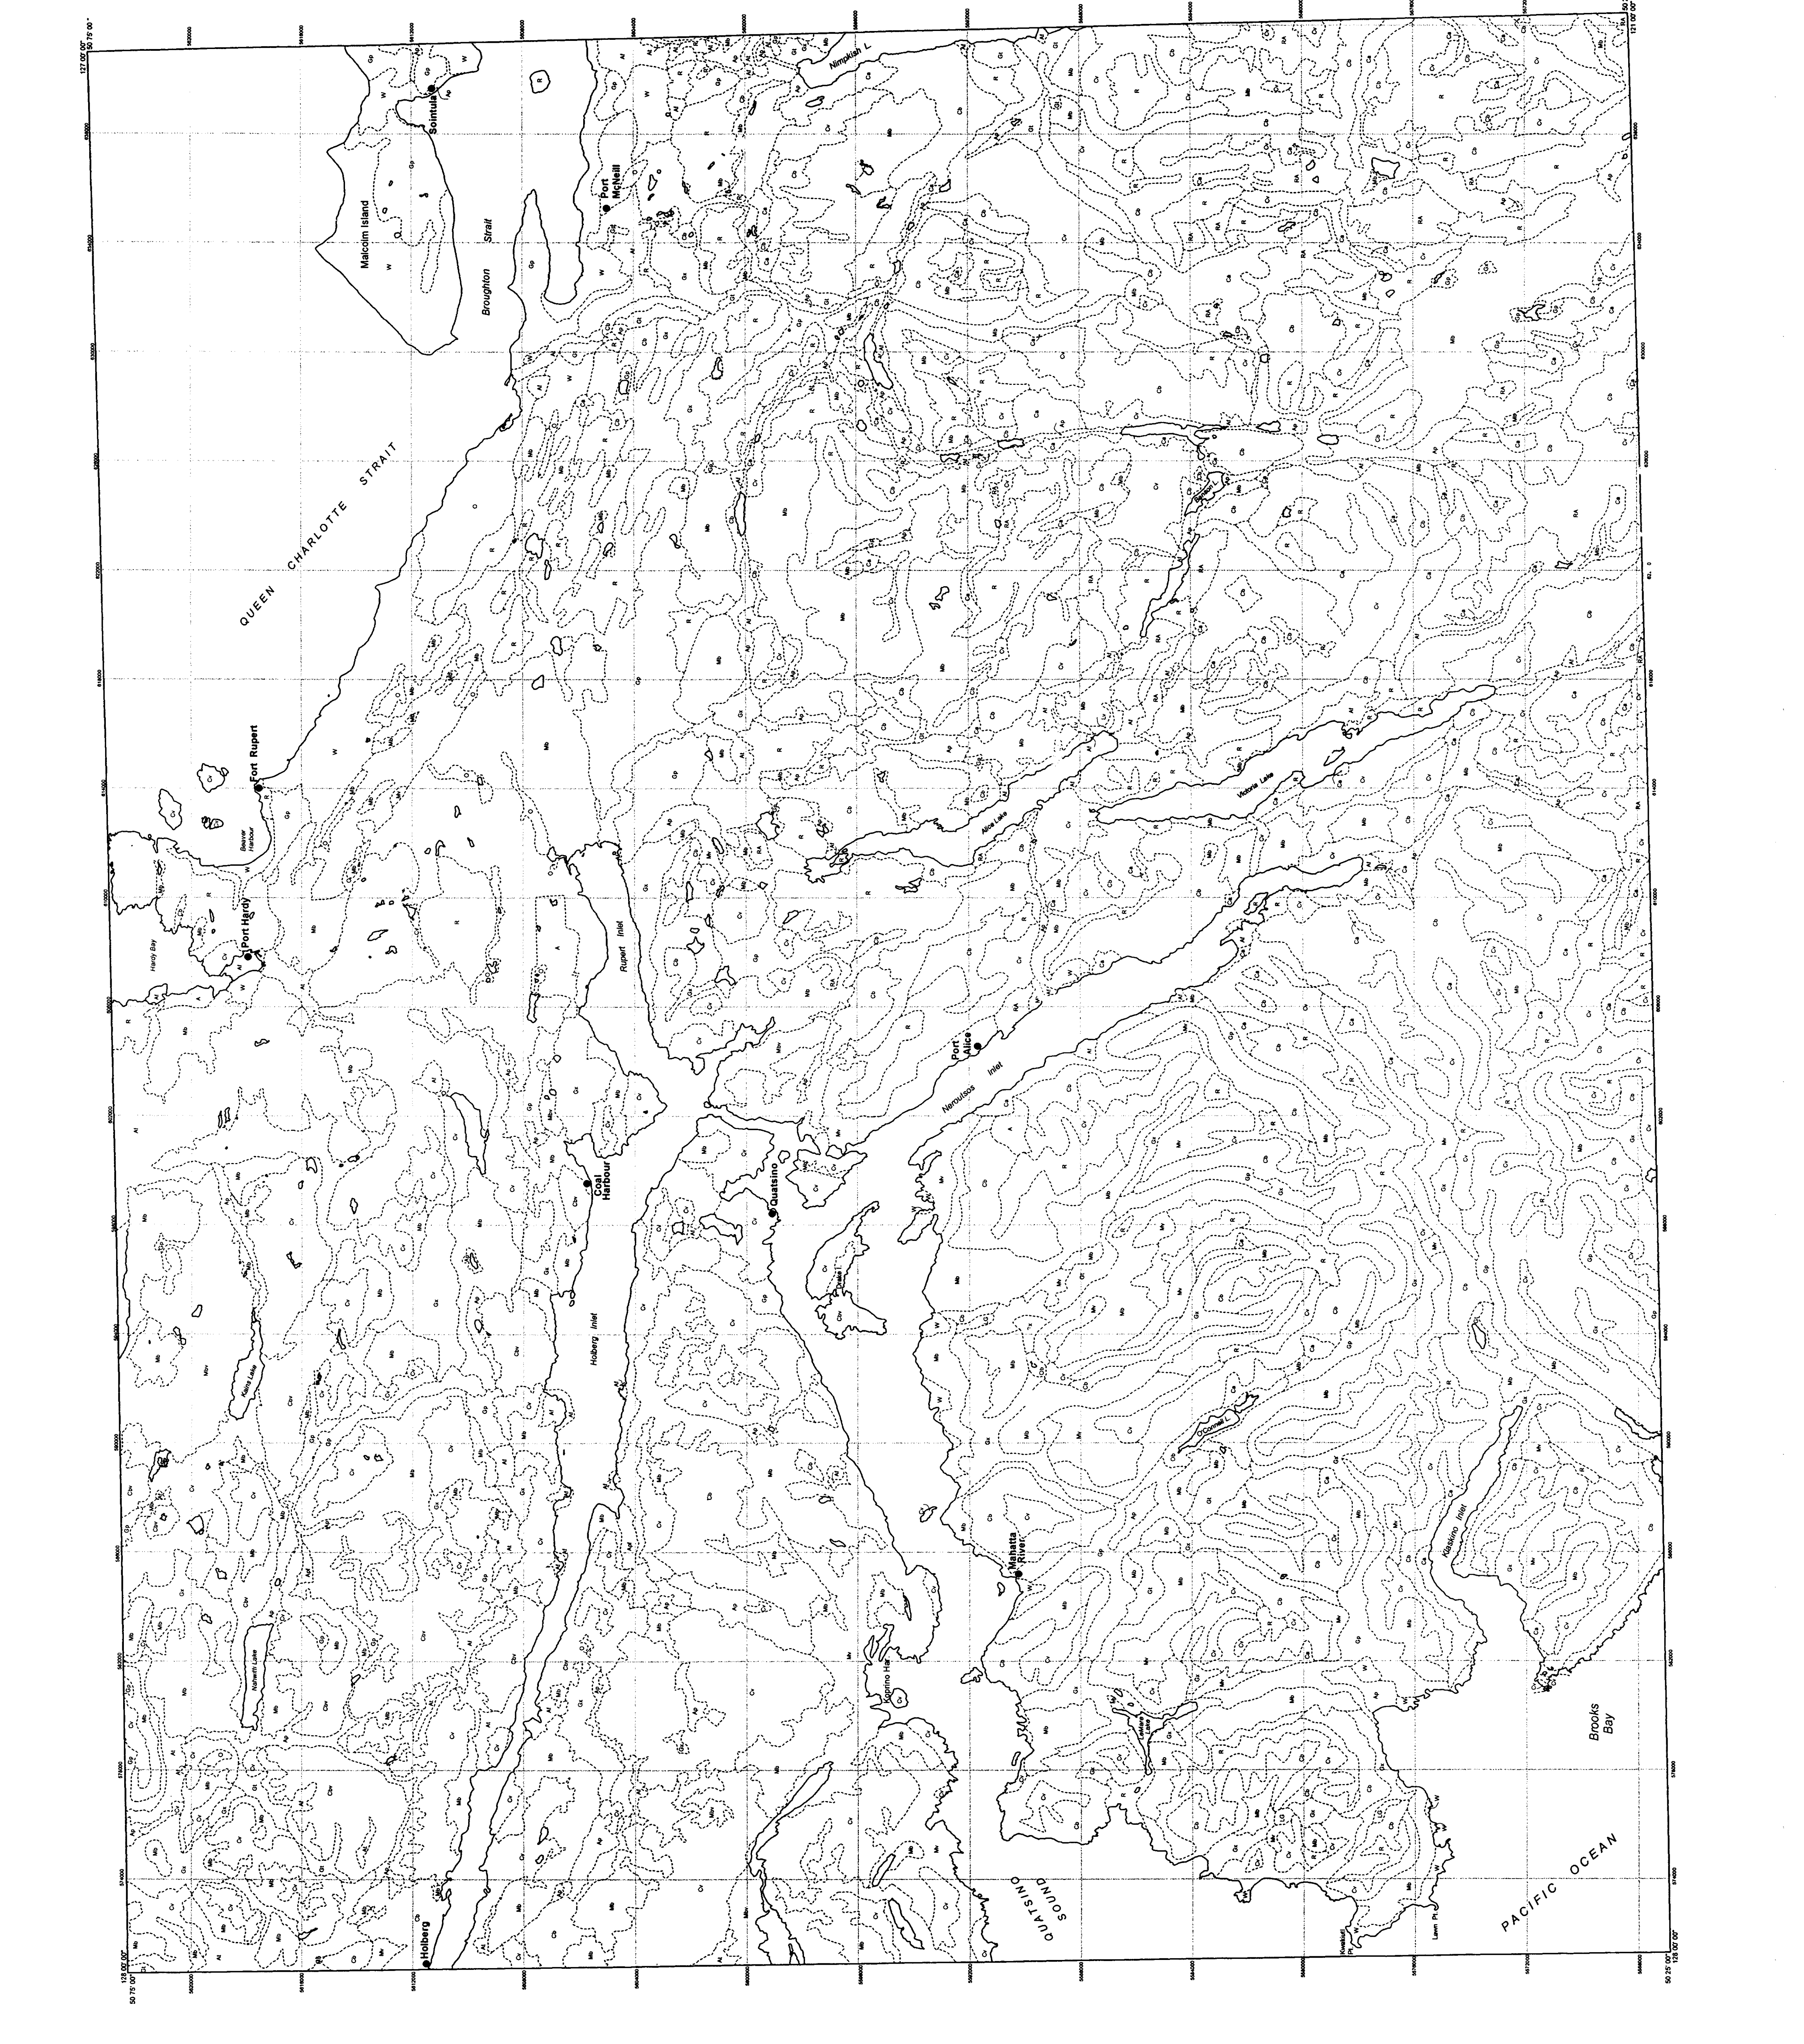

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.

- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
- GLACIOLACIAL DEPOSITS: cobble to pebble gravel, including minor sand and silt; generally > 1 m thick, includes local organic and lacustrine deposits in abandoned channels, depressions and backswamp areas; floodplain areas subject to occasional stream flooding and sediment reworking.
